>emial address for Dieter.

IMHO the latest version is v3.16 date: 4 feb 1996. As I received my
copy from the Net I know for sure one can find it somewhere on the
Net but I can't remember me where. Search for gvw_v316.pax. You also
need the install program but I believe this is provided with the
masterdisk.
The e-mail address of Dieter is dieter_fiebelkorn@do2.maus.de
>
>On a related but different note: Anyone have a JPG import module for
>Pagestream and/or Calamus SL? I know ther's none with the packages
>themselves but didn't know if any have surfaced separately. How
>about newer printer drivers?

I don't have a jpg import module for Calamus but there excist one at
least here in Europe. I've shaw once an advertising but again I can't
remember me from who or where.
If you want to know more about some very usefull but very expencive
German Calamus modules go to http://www.geld.com/as/. (Adequate
Systems)

Go to http://www.dmcpublishing.com if you want to know more about the
forthcoming Calamus update.

## 4. British magazines for sale (US)

Newsgroup: comp.sys.atari.st
Date: 1997-01-01 00:00:00 UTC
From: trek@ihgp15.ih.att.com
Message-ID: <5adl46$eu4@ssbunews.ih.lucent.com>
Source record: 130869

England has had some very good Atari magazines over the years.
Here's your chance to own some of them without paying the normal
high costs (~$8 no disk and ~$10 with disk).

Atari ST Users/with disk: 10/90 (#56 - complete guide to making music)
4/91 (#62 - public domain special)
11/91 (#69 - art and sound special)
3/94 (#98 - desktop publishing special)

Atari ST Users/no disk: 12/90 (#58 - paint packages, space games)
3/91 (#61 - 3d graphics tutorial)
6/92 (#76 - word processing and emulation)

Atari ST User-JUST disk: 7/90 (#53); 1/92 (#71); 10/93 (#92)

Atari ST Formats/no disk: 4/91 (#21 - animation special)
5/91 (#22 - fix broken disk, dtp secrets)
7/91 (#24 - making video masterpieces)
8/91 (#25 - 37 ways to expand ST power)
9/91 (#26 - virus special)
9/94 (#62 - ST expansions)

Atari ST Formats/with disk: 2/90 (#7 - first color digitizer)
10/90 (#15 - Art special, Dpaint & user guide)
2/91 (#19 - 30p to tips, guides, help, jargon)

Atari ST Format-JUST disk: 3/90 (#8)
11/91 (#28)
1/92 (#30 - both disks)
12/92 (#41 - 1 disk - Protext v4.3)

Minimum order $5. Buyer pays shipping from Chicago suburb.
(all prices US$)
Magazine - $1.00 Magazine + disk - $1.25 disk only .50

The write protection of zip disks is done in software. Have the zip
disk un-protected on a friends pc. Or get the new software from
Oregon Research that has the capability of twiddling with the write
protect bits on the zip. Wayne Booth

And the real ST is cheaper and correctly "emulates" all of the STs
functionality.

Darek never learned what a customer is.

I too won't buy any Darek product because of his attitude towards
customers. (Had one once then tried dealing with him. Never again.)

Maybe, but they are vastly superior in _speed_, as far as I can tell.
That's the problem with 1stGuide: I'd only need it for MPEGs, and all
those I have ever seen are just too slow to enjoy on my hardware
(TT030/Crazy Dots HC). So, I just keep 1stGuide somewhere on my drive
without ever using it - for everyday use, I just take Graftool (which
also plays .FLIs, .GLs and .DLs in windows!).

>So, it's a waste of time IMHO to deal with AVI/MOV,

Well, if you get ready-to-install routines, I guess the result would
be worth the effort.

Thorsten

hi,

Is there an Atari Web Browser? If so, will it run on an Atari 1040Stf?
TOS 1.0? Where can I get my hands on it? Is it shareware? Commercial?
Please e-mail me with info as I don't get all the newsgroups.

Thanks

Mykle

## 10. Sell me your Atari junk!

Hi,

Keep those offers coming!

Some of you know me. I've bought quite a bit of atari "junk" in the past two weeks, from complete ST systems to hardware to software. Well, I'm not done yet. I still need software and I still need an external floppy for an Atari 1040Stf. I "WILL" buy from the best offers that I receive so send me your lists and get some money for that junk and regain some closet space.

Hurry, I won't be buying forever and you'll be stuck with it!

Mykle@con2.com

Hmmm. Well I use modem2 on the TT, hsmodem7 (drvin, mpf, mfp_tt, scc), and I have never been able to get an OK response from the modem (Courier dual standard or the new sporster voice) at more than 38400. I have tried with just about every terminal prog in existence, including CoNnect95 and CoMa.

It is probably me buggering it up but I don't know where :-(

Is there a kind soul out there who is getting 115200 on the TT modem2 and can zip up their hsmodem executables and send them to me?

Pretty please?

With all due respect, Harry - this is utter rubbish!
Of all the Atari's I've owned (and I went right from the start with a
520ST with tos on disk), the Falcon is the most stable. In my
experience, crashes and errors are in 95% of all cases a result off faulty
user settings and configurations and incompatible autoprogs and accs.

>My questions are, can it be done, and if so how?

ISDN line would require an ISDN modem (the industries term - but
its not a traditional modem - it doesn't convert from digital to
analog.) The hard part would be getting driver software for it
for the Falcon.

My son, also a Falcon owner, faced a somewhat similar quandry
when he went to the Illinois Math and Science Academy (IMSA)
but there they provide ethernet to the rooms (not ISDN).

First we went for an Adeptec Nodem, a box that sits off of
the scsi port and does ethernet. The driver software that
comes with the Nodem is Mac software (System 6). Jonathan
decided he was going to write the driver software so it was
native Atari - but in the weeks while we waited for the device
to arrive, he found an old SUN 4-110 for very cheap so he
bought that and was up on ethernet (null modemed the Falcon
to the sun, set up tables on the sun, had an IP address
assigned to his Falcon) and was in business. That still
left him with some problems but the sun had solutions for
most of those (no mosaic on the Atari - this was several
years ago before Netscape days.) He hooked up the nodem
and got lights on the front from it but never did write
the software. And he didn't try the mac software under
GCR unfortunately.

Anyway, I have one Adeptic Nodem T LIU (line interface
unit - a very professional box that stands upright, about
2" wide by 5 1/2" deep by 8" tall - 3 activity lights on the
front - complete with power, 2 scsi connectors, scsi id
setting switches (external) and an T connector (for ethernet
running over unshielded twisted pair - the 8 contact
telephone like jack - wider than a normal telephone jack
though) and manual for sale if anyone is interested.

I'd like $75 plus shipping (from Chicago Suburb) for it,
if anyone is interested. Wayne Booth

## 14. Re: PC mice and ST Mice

Newsgroup: comp.sys.atari.st
Date: 1997-01-01 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.95.970101085832.24411B-100000@moose.erie.net>
Source record: 130879

Yes, it's possible. You can use the common PC serial mouse by
running a serial mouse drive like Cyrel's or MOUSE24. This is most useful
on a Mega STe or TT which have multiple serial ports.

You can also use a PS/2 (bus) mouse in the regular mouse port if
you change the connector on the mouse from a 6-pin mini-DIN to a DB-9F.

Hi thorsten,

Yes to all the above, you are right, but Guido's response didn't seem that
friendly so I didn't bother. Guillaume's m_player is a great product and I
hope he will support mpg's in due course...

Didn't know about graftool, I will have to have a look.

Hi Dave,

dave (dave@mbha.demon.co.uk) wrote:

: I use modem2 port all the time on the TT. I understand there is an easy mod to
: connect the modem2 port to the serial2 clock making faster baud rates possible
: on modem2.

In the German docs included in the HSModa07-package the procedure is
described (SCC_X.TXT). It says something about one cable has to be removed
or isolated (pin 17 of TT-MFP [MC68901]), pin 32 of the SCC (Z85C30)
reconnected to pin 13 of the SCC and the set of serial speeds changes to
speeds understandable for modems (57600, 115200 bps). In the settings of
the SCC.PRG you have to select "Falcon" instead of "TT".

I gave my TT to a technician to do the hardware modification and it works.

: Can anyone come up with a schematic or picture showing where the track should
: be cut and where the new wire should be soldered?

I tried to translate this short text, but I am not a technician! It says
in the subtitle "for experts only". So perhaps try to find somebody to
cross-check this thing before you start to dissect your TT!

Bye,

Kerstin

There are two kinds of telephone cords, known as class A and class C,
otherwise distinguishable for having 4 wires and 8 wires. For any
computer-related use, you need 8 wires, or class c.

> That's right AFAIAA. The following *edited* extracts come from the Graphics
> File Format FAQ - see section 3 in particular:

Unfortunately, that info is obsolete (you seem to be looking at an
old copy of the GFF FAQ). Recently, Unisys have been actively trying
to suppress freeware/shareware implementations of GIF.

The info I have is -
* Unisys now considers unlicensed freeware LZW code to be legit
only if it comes from an "educational or charitable institution"
and is distributed directly to end users. At least one freeware
programmer I know has been threatened with a lawsuit by Unisys
if anyone else used his freeware GIF library in a commercial
product without a license. That is obviously not something
under the programmer's control; his only way to satisfy Unisys
is to pull his library off the net.
* Unisys will no longer grant licenses for LZW-using programs that
are distributed as shareware. The shareware author must cripple
GIF load/save capability in unregistered copies, so that GIF can
be used only after a shareware fee is paid (at which point Unisys
is due its percentage). To my mind, a crippled program is not
shareware at all, just a demo for a commercial program.

The "LZW licensing Q&A" document (which used to contain Unisys' promise
that freeware GIF programs were OK) has disappeared from www.unisys.com,
and all you will find there now is a terse statement that they have
changed their licensing terms for LZW. The above info is second-hand from
developers who have actually contacted Unisys recently.

I think it's high time the net community said "Enough" and stopped
using GIF. Consider PNG instead (http://quest.jpl.nasa.gov/PNG/).

DBman - last atari version 5.3 was still available through toad up untill
a year ago. It is completely file and program compatible with dbase III
and has some of the dbase IV functions as well. I have been using it as a
database program since 1986. It is much better than any of the other
available alternatives. (although I would reccommend using version 5.2 as
it appears to work better than 5.3 on an ST. According to versasoft, the
5.3 version was compiled on a TT to use the 68030. BTW we tested the
same dbase program on a 8 MHz ST, a 12 MHZ 286, a 16 MHz 386, a 33 MHz 486
and 32 MHz TT.The program was run on dbase III on the PC and dbman on the pcs with the
same data files. The results were something like:

ST - 1min 26 second
286 - 4 min 18 seconds
386 - 1 min 18 seconds
486 - 22 seconds
TT - 8 seconds

Remember thius was exactly the same program and data files so there was no
difference in approach. I never bad mouthed the speed of my ST again.

BTW I wouldn't compare these times to the same program running on FOX it
is 4 - 8 times as fast as dbase.

If you are looking for a program that will import dbase files, try atari
works. It unfortunately doesn't have the same relational capapilities.

I tried at least one of them on floppy, putting all files in the root directory, but still got the Error -33. Nothing in the docs say anything about putting them on floppy or having certain files in certain folders. I also looked inside the program with a binary editor and A:/ is not hardwired into the program (nor does it access A: if I try to run it from the hard drive). Thanks for the suggestion, though.

># Regards, Harry Sideras - UK Association of Atari User Groups #

I reckon it's problems with HDDRIVER 6. I have had exactly the same sort of hassle. I use an internal Seagate IDE along with a Quantum SCSI, and Syquest drive. Upgrading (there's an oxymoron) from V5 was a badd! move. For some unfathomanable reason V6 consistently misses the IDE. Disconnect all the SCSI devices, reformat the IDE should solve the problem (so says System Solutions). Even on a bare-bones system the programme is useless. Better yet the bloody thing managed to screw the C partition and I lost V5. Why do suppliers assume that the old programme is not wanted and insist on having your original disk so they can wipe it off?
Three months have past and still got no joy, as usual must be the customer's fault. No one else has had problems so I'm told, but then why did this thread start?

## 25. IRC/Demon answer

Newsgroup: comp.sys.atari.st
Date: 1997-01-01 00:00:00 UTC
From: Mark Gardiner <100550.3170@compuserve.com>
Message-ID: <970101200403_100550.3170_EHK33-2@CompuServe.COM>
Source record: 130890

OK,

I had problems with IRC on Demon after they changed their Servers. A lengthy telcon with support was virtually useless as they claim not to support IRC ???

Anyway you won't get anywhere with AtarIRC now if you try to log on to either dismayl or irc-client(.demon.co.uk) but you can access via:

irc.stealth.net

when connected you can get the efnet(or other) connection by issuing the /server xxx - where xxx = the url

*NOW can someone help me???*

I logon as above on the ST to IRC but for speed often use my Palmtop PC.
This is a DOS machine and using Nettamer I Telnet to dismayl.demon.co.uk (I know silly isn't it!) and have to accept a no terminal ASCII setup. This is OK but I can't DCC ???

Now I have received OK on the ST but sending is too slow for people to be bothered with so I thought I'd try the PC.

The commands I use are as follows:

/DCC send <nickname of recipeant> <file and path>

I get back a message that the file is not found but with two forward slashes in front of it so for example I want to send a file called IRC.TXT

/DCC send You a:\IRC.TXT

I get "Cant find file //a:/IRC.TXT"

The forward slash is I assume a Unix dir indicator and similar to HTML local directory indicators? Even placing the file in the root dir is no use?

Another thought I have is that I can only log on with ASCII (IRC11) emulation. I have tried VT100 but it returns "Unknown terminal type"

Any thoughts appreciated.

Mark.

Toad is about the ONLY company tha still regards Atari computers as real computers. Most of you guys still think of Atari as nothing more than a game platform and sell them as a simple game server. Its the users of Atari computers who have driven the prices down in private sales. A guy buys a 1040 for $700 and a few years later nobody will pay more than $50 for it. C'mon now folks, the hardware is much better than that. These are REAL computers, not nintendos.

Toad recognizes this fact and sells their stuff as real computers. They also stand behind their sales if something goes wrong. Toad currently sells a 1 meg 1040 for $199 and thats a very good and realistic price, but if a guy advertised one here for sale as an owner looking to sell his stuff, most of you would say thats too much for a 1040. SO admit it folks, either you have real computers or nintendos for sale in this group. I say that Atari made real computers and I bought them as such and will sell them as such when the time comes.

I thought I'd add my thoughts on this matter as no-one else seems to have mentioned the following trio of programs. First off Multi-layer, main problem is it's all in German, and the German-2-English translator programs, even supposedly technically oriented ones, came up with a particularly hilarious, if completely unusable, translation of it's documentation when I found its demo on a CDROM. PCBoard Designer wasn't bad, but restricted itself to Eurocards as far as I can tell. Platon looked the best of the three demos I saw, easy to use (very GEM) to the point where you hardly needed the manual at all, it did photoplotting on a huge range of plotters, and given you can pick up an HP7475A for less than 100 UKP you could probably justify getting one purely for PCB use, it also did Gerber/NC output, its only problems are it only supports two-layers plus two screens, and it isn't available anymore. That said, Goodmans, the software people, have promised to try and get the rights from the original publisher. It used to cost about 300 UKP, but so did Technobox Drafter, and that now costs 25UKP from Goodmans. If they manage to get it I'll be at the front of a queue waving a cheque at them.....

I got my IDE drive back up but Mike's response has me worried about HD Driver 6.0. I tried all of Harry's suggestions (thanks Harry!) but I could not get into the IDE drive to fix any driver problems. The HD utilities program showed my IDE drive in the IDE parameters window. Setting up the device configuration with I0 then S0 seemed to do no good. The odd thing was that if I used the Auto config approach the the device config window then showed that there was no IDE 0 installed. Something's not right here. Anyway I got the system running by reinstalling the old atari drivers (AHDI 6.04) into the IDE drive from a plain default desktop with no harddrives available. This got me into the IDE. Then I erased the HDdriver files in the ide, reconnected the scsi chain rebooted & presto both SCSI drives and my CD Rom (with extendos) reappeared. I had originally assumed that I had just made some kind of mistake configuring HDDriver when I started adding to the SCSI chain. Now with mike's similar problem, I'm not so sure. I think I'll wait before trying again, at least until Uwe has a chance to comment on this problem. After all, at least my system works now although with a less powerful driver.

Yeah, sounds just like my provider. After my college account was
erased(year after I stopped going to scholl but I used it anyways), I had
to use some stone age IRC program on the shell account that hardly works
right. Then they stop providing it because some idiot kids were ever
hacking or doing some other abuse. Well, I'm done ranting... :)

I'm not sure if you are using a text-only shell account to which you are telnetting into. Ok, with those you can't send the files on your disk straight through IRC. But, you can upload those files to your home directory on your account. You may try to FTP(on your SLIP connection) or typing rz filename.txt, perhaps you might want to ask your provider on how to do this.

## 36. Re: Atari Works Printer Drivers

Newsgroup: comp.sys.atari.st
Date: 1997-01-01 00:00:00 UTC
From: Tom Lamparty <Lamparty@concentric.net>
Message-ID: <Pine.SUN.3.95.970101215410.2186C-100000@viking.cris.com>
Source record: 130901

Atari Works uses any version of GDOS for it's font handling and printer
output, be it GDOS ver.1 or SpeedoGDOS ver.5 or even NVDI 4! I'd recommend
either Speedo 5 or NVDI5 since you have a Falcon! Speedo5 come with an ACC
for installing fonts and drivers, NVDI uses a couple of CPXs. You must
have some form of GDOS installed right now or it wouldn't print at all!!
If it is speedo then there should be a couple of programs on your hard
drive somewhere, driver.prg and outline.prg, just rename them to
driver.acc and outline.acc and they should solve your problem.

On Tue, 31 Dec 1996, Ted Parrett wrote:

Steve Jordan requested that I post the following message:

I don't have access to the newsgroups and I was wondering if you could
post this on your atari news group for me. I will pay up to $30 for just
the english manual, $40 for a full amiga version of the game(english).
Also, if anybody has any faqs/hint sheets on the game I would really be
in your debt, Im not getting very far in it.

Thanx for your attention,
steve

P.S. dont REply to this e-mail .Send e-mail to

Mark Gardiner <100550.3170@compuserve.com> said:-

>OK,
>
>I had problems with IRC on Demon after they changed their Servers. A lengthy
>telcon with support was virtually useless as they claim not to support IRC ???

That is quite right, like virtually everything that Demon provide
(except Mail and basic connectivity) it is unsupported. Fair enough
really they haven't got the time to mess around with it or help people
out as it is hardly a high priority service, better unsuported than
not existing atall I say.

>Anyway you won't get anywhere with AtarIRC now if you try to log on to either
>dismayl or irc-client(.demon.co.uk) but you can access via:

I don't find getting onto demon any problem atall, I just type:
/server irc.demon.co.uk 6667
and off it goes and connects me!

>I logon as above on the ST to IRC but for speed often use my Palmtop PC.
>This is a DOS machine and using Nettamer I Telnet to dismayl.demon.co.uk (I know
>silly isn't it!) and have to accept a no terminal ASCII setup. This is OK but I
>can't DCC ???

>The commands I use are as follows:
>
> /DCC send <nickname of recipeant> <file and path>
>
>I get back a message that the file is not found but with two forward slashes in
>front of it so for example I want to send a file called IRC.TXT
>
> /DCC send You a:\IRC.TXT
>
>I get "Cant find file //a:/IRC.TXT"

I think that DCC is impossible via telnet, a normal IRC connection has
something like:
YOUR MACHINE-IRC SERVER-THE REST OF IRC
whereas going via a telnet gateway you get:
YOUR MACHINE-TELNET CLIENT-IRC SERVER-REST OF IRC

In the first example you send your commands to the IRC server and it
carries them out, in the 2nd example your machine sends the commands
in ASCII to the telnet server which then issues them o the IRC server
and so the IRC server thinks that the telnet server hass issued teh

commands, the telnet server tries to send said file and it finds that
it doesn't have any such file on it's disks and you get the error.

>machine and find out.

What you say is quite true but many boards such as the Compo one, fit
directly onto the 68000 so may cause problems, if you have a board
like mine which has a manual switch then all should be fine, it is a
small board with 2 sets of chips on it which plugs straight into the
ROM sockets and uses an manual switch, this will work fine.

Mykle schrieb:

M>Is there an Atari Web Browser?

yes, there are two:
1) CAB (from Alexander Clauss, Germany) fine working, together with STIK
2) ??? another one, who just can only read local files and who ist just in a early development state.

M>If so, will it run on an Atari 1040Stf?

yes, but 1MByte of RAM is very less!

M>TOS 1.0?

??? i'm not shure... TOS 1.2 (I guess) or better 1.4 (shure) ist preferred.

M>Where can I get my hands on it?

Somewhere in Germany, visit the STIK support page, there is a link.
Or use archie for seraching.

Michael.

## 42. Making Animated Gifs [Falcon]

Included with Speedo should be a program called "DRIVERS.PRG" or
"DRIVERS.ACC". Start this up. It will allow you to change printers.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
~ THOUSAND AND ONE GOLDEN WISHES ~
~ TO EVERY SENSITIVE BEING ~
~ ALL OVER THE ~
~ WORLD AND UNIVERSE ~
~ ~
~ FOR THIS NEW 1997 YEAR ~
~ EVEN IF TIME REALLY DOESN'T EXIST ~
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
```

My thousand and one wishes for the new year are;

- Peace all over the world and nations.
- Compassion and love to each sensitive being.
- Free Tibet coming soon.

And also;

- Atari passion & enthusiasm continuing ...

* first for developers
* secondly for publishers & vendors
* and above all for users who are the engine of the
whole market ... whises to not forget to give their
contribution to the developers. It's the silver key
to make them continue their golden work ...

- And a special wish to the developers of Oasis to bring them
to a quality product more and more stable; the program
deserves quality not obtained until now;

Note to the Oasis developers; after three weeks of use and
help received from Martin Byttebier to configure the program,
I'm now decided to register even if I'm not yet convinced
of the stability/quality of the new 2.10 version. I hope it
will incite the developers to go further.
Whathever I can say, it's with that program I write to you
now, and at least that's the miracle ! Thank you.

You will need to get the flare gun first. It is found in the purple
desert in the SW corner. To get to the purple desert, use the cave
in the SE corner of the cactus desert.

Hint: the T.Rex only comes out at night.

BTW, have you found the coal deposits? I have saltpeter and sulfur,
but no coal.

## 51. Atari ST with hard drive for sale

Newsgroup: comp.sys.atari.st
Date: 1997-01-01 00:00:00 UTC
From: Sean Henry <shenry@orc.ca>
Message-ID: <01bbf7ab$c01fd300$3bf42fce@jupiter.orc.ca>
Source record: 130964

Subject: Atari ST for sale

Hi, I'm a teacher in Stratford (Ontario, Canada) and I've recently,
reluctantly (for my
kids), made the move to PC.

I have put a lot of time and money into my
Atari ST, complete with SyQuest hard drive ( plus two SQ400 44 megabyte
disk cartridges),

C-LAB Notator SL (MIDI sequence and score/edit printout
system, etc - paid a fortune for it...),

all of the Band in a Box series,
plus Jazz Guitarist and Pianist, etc.

I also purchased the Easy Draw
packages (including Supercharger) from Migraph.

-Computereyes - Video digitizer

I could go on...

I have all the original software and manuals.
I'm looking for a good home for this very complete system - specifically a
musician who would appreciate the mountain of music software.

I would also like to get a few dollars...

If you would like more information...

(I could deliver the system to Toronto, Ontario, Canada, if necessary)

Please Email me at
shenry@orc.ca

Sincerely,
Sean Henry
Nor'wester Coffee House
http://www.orc.ca/~shenry/index.htm
See you there!

system. That's life. Or be happy with DOS 5.0.

: I for one, am extremely annoyed at Andreas' arrogant attitude of 'it's your
: fault for having a 'unstable' Falcon'. Yeah right! Nobody mentioned 'Falcon

No, that's not fault but bad luck.

: compatible (if you're extremely lucky)' when I spent all that money on it!
: So am I likely to get a refund? I blooming well doubt it!!

The fact is that we tested some falcon machines without any hardware changes
and without AUTO programs etc. On some machines MagiC simply does not work.
I understand that this is annoying for you, but there is no way to change
this. If we had known this problem earlier, we would have described MagiC
as "Falcon-compatible, but critical on some special machines, so try it".

The old machines (ST,TT) just cause less trouble. The difference between
two individuals is much smaller.

## 59. Eureka a graph describer and 3D modeler

Newsgroup: comp.sys.atari.st
Date: 1997-01-02 00:00:00 UTC
From: lecoat@tokay.ief-paris-sud.fr
Message-ID: <5ag53h$rml@upsn6.u-psud.fr>
Source record: 130822
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platform such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN and STonX.
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcomed ...
Have fun with my production, bye for now ...

Thorsten Guenther wrote:
>
> for everyday use, I just take Graftool (which
> also plays .FLIs, .GLs and .DLs in windows!).

But did you ever ask why these authors support
all kind of crappy and stupid formats, except
MPEG?
Because they are obviously *unable* to do the
*real* thing!
And they are in good community with users like
you who are unable to evaluate technology in
terms of common and open standards, future
potentials, and quality.
If you ever took the effort to study the MPEG
technology, you would immediately forget
about AVI, MOV, and other stuff.

I'm sorry to say that, but I've nothing in
common with your kind of approach.

> >So, it's a waste of time IMHO to deal with AVI/MOV,
>
> Well, if you get ready-to-install routines, I guess
> the result would be worth the effort.

Again: I won't waste my time with this stuff,
and I won't waste any space on my drives with
this kind of data and programs.
Of course, that's *my* approach, if you are
happy with this stuff, please keep it.

But, as said before, your approach retards
development and usage of *real* digital video
and only adds confusion to users by wildgrowth
of incompatible formats.

BTW, I don't expect that you accept my viewpoint,
but I thought I express it clearly here to help
understanding it :-).

Regards,
Guido

: Am I misunderstanding something here? Modem 2 is capable of at least 115k2
: in its unmodified state. I'm using 57600 on Modem 2 with a Mega STe (same as
: the TT) with Semper, STiK and CixComm.

He was asking about the TT modem 2 port which is different. The original setting of modem 2 of the TT goes up to 153x00 bps. But the speeds from 38400 on upwards are not standard and not supported by most modems.

With HSModa07 you can use serial 2 even up to 230000 bps without any hardware modifications and this port has got the standard modem speeds but for incoming calls you have got to trick a little bit, because one type of signal is missing. Anyway, V.34 modems only support up to 115200 bps. External ISDN-adaptors should work at 230 k and perhaps V.34+ modems.

So to get 115200 bps either modify modem 2 or change to serial 2 with limitations in receiving calls.

Bye,

Kerstin

>
> Is this a limitation of the terminal you use? In cases like that I reassign
> the lower baud rates in conjunction with HSModem's SCC.PRG.

It's not a question of the maximum rate, it's a question of the possible values. The clock used for the Modem 2 port it as such an odd value that it is not possible for it to generate anything close enough to 57600 or 115200 for most modems to handle.

Doing the hardware modification in the HSMODEM docs essentially re-routes the clock signal used for Serial 2 into the portion of the SCC used by the Modem 2 port.

Source record: 130835
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,

I have a 40meg external mac HD, and would like to connect to my 1040. Is there a standard cable that would work? What would be the best driver/editor software to start 'er up once I get a cable?
Also, I'm looking for the best way to download software from my mac, and transfer it to the ST. I've had some success after unzipping, and saving to a 800K DOS disk, but looking for a more reliable system.
I've hooked the ST to my mac with a null modem cable before, and it transfered ascii just fine. would this be a better solution for transfer?

Thanks in advance,
Mark

>: I have a Mega ST4 and wish to extend the Keyboard cord. I bought a standard telephone cord and it didn't seem to work!
>: Any ideas or mods? thanks in advance!

I just happen to have the cord to my Mega 4 ST handy - system was just taken down for sale. It's a 6 wire plug - repeat _6_ wire. Also, it's wired as a "pass-through" rather than a "mirror-image". In other words, the two plugs look identical - what's on the left on plug 1 is also on the left on plug 2. Telephone plugs IIRC are wired as a "mirror-image" - or at least I've seen some that were. Any 6 wire cord that is wired "pass-through" to the right plugs (6 pin male) should work - though likely you'd pick up some noise if made a _very_ long one. Restrain yourself to 5 feet or less and it should work fine.

>There are two kinds of telephone cords, known as class A and class C,
>otherwise distinguishable for having 4 wires and 8 wires. For any
>computer-related use, you need 8 wires, or class c.
>-------------------------------------------------_-----------------------
>jimd1 __ __ ____ ___ ___ ____

This response was obviously written by a well-meaning soul who _didn't_ have a Mega 4 keyboard cord sitting in front of him (grin). Please be _sure_ of your facts before you advise (and confuse) other users. If there was a non-standard way to do something, Atari would be sure to use it!

## 75. Re: dBase III+ compatible database applicat

I can't think of making them work without an Atari... Except perhaps
if someone had developed a replacement for the laser interface that
works with something else than ACSI...

: Can you still get cartridges for them and if so, approx. cost?

Try finding a dealer who has a goodcompatibility list. Both SLM printers
are compatible to some model from TEC, usually it's no problem to get toner
and drums. For the SLM804 they are more expensive than for the 605, though.

Alex.

>
>Anyway you won't get anywhere with AtarIRC now if you try to log on to either
>dismayl or irc-client(.demon.co.uk) but you can access via:

Well I'm not an IRC-er (though I am thinking of trying it out), but I
am a Demon customer and subscribe to the demon.announce newsgroup.

Most of the following is from memory, so its accuracy may be doubtful:
I'd check the web pages if I were you.

IIRC dismayl was never a supported name: the machine is called
irc.demon.co.uk, and is now only connected to IRCnet. The new Efnet
server in beta testing is called efnet.demon.co.uk. IIRC (again...)
irc-client is for telnetting into a public IRC client if you don't
have an IRC client available on your machine, so it won't work with
the AtarIRC client.

From a posting in demon.announce:

Details of IRC and the Demon service can be found at:

http://www.demon.net/connect/services/irc/ and
http://www.demon.net/faq/config.html#ircserver

>Is this magpatch.ttp? It ought to have docs in an archive called MPATCH14.
>If so, the most recent I've seen is as follows:

<snip>

I don't think so: it's just called M5PATCH.PRG and doesn't seem to be
an archive. I though it might be and tried running it without MagiC
loaded (to be on the safe side) and it just crashed IIRC, no sign of
it trying to unpack itself. Sort of hints that it might want to be in
the Auto folder or something but I didn't want to risk it without
knowing precisely what it does.

Thanks anyway!

Source record: 130846

Well Malcolm, I use HDriver 6 along with Magx 5.03 and NVDI 4 -see list of
programs that I use.
-Papyrus 3
-Imagecopy 4
-Apexmedia
-Calamus SL
-Pagestream 2.2
-Extendos...The list could go on a while !
The point being I have a lot of top notch programs that mysteriously seem to
come up with memory faults under Magx 5.03 that were working under version 4
but not now . Why ? I think that's the question everyone wants answered
instead of a crap answer like it must be the Falcon that is the problem .
Until someone from the Magx group of writers addresses this situation then
the problem will continue . Maybe it's time to try out Geneva to see how
this operates with a Falcon .

That's fine if you're a rich corporate user. Just throw it out and buy a new
one. Hardly practical (or desirable) for a home enthusiast is it?
Anyway, how many home users run NT. Not a lot!! Maybe that's why!

>The fact is that we tested some falcon machines without any hardware changes
>and without AUTO programs etc. On some machines MagiC simply does not work.
>I understand that this is annoying for you, but there is no way to change
>this. If we had known this problem earlier, we would have described MagiC
>as "Falcon-compatible, but critical on some special machines, so try it".
>
>The old machines (ST,TT) just cause less trouble. The difference between
>two individuals is much smaller.

But the thing is, you must have some idea as to what is causing the
problems! If you were willing to try and fix it, I'm sure plenty of people
(myself included) would be more than eager to help test any fixes for you!

I just want a stable o/s that exploits my Falcon to the full. I've invested
in MagiC! So I'll willingly help out if it means I get a stable o/s.

I shall probably be upgrading my Falcon with a Nemesis board this week.
I'm just praying that MagiC is going to cope with it!

I'm currently trying MagToRom 1.2 to try and prevent the memory problems.
It seems to have sorted it, but it's a bit early to tell yet :)

Regards, Gary

Hum , again your statement has to be questioned as I have also had a
520,1040 ST/E and a TT before getting my Falcon Tos 4.04 and this machine is
a hell of a lot more stable and advanced than any of the previous Atari
machines. If you discount the famous sound bug that seems to have been the
only reason why a so called German Falcon came about ie: C-Lab which is no
longer supported by themselves even then the Falcon walks all over
everything previous . The only exception to thisis the speed of a TT .

His name appears in the copyright so this makes him along with his other
partners the owners of this software therefore all of them are responsible
for their products shortcomings no matter on what system it is used on . Is
this going to be their excuse when it bombs out on the PC side that because
it was made primarily for the Atari line of computers that some bugs in the
coding makes some programs unworkable ? I hardly think so but having read
the arrogance of these guys it should go over pretty good with Bill Gates's
attitude towards his customers . Can you tell the difference ?

p> With all due respect, Harry - this is utter rubbish!

You may hold that opinion if you like, but I'd suggest popular experience
indicates the opposite.

You'll already know from Doug that a good summary of the reasons for the
delay in shipping Nemesis is that they were increasing the build quality to
such a level that the inconsistencies from one Falcon to the next were
finally overcome. I think that tells its own story, don't you...?

a> How do you add additional icons to the icon file in Magic 5's Gemdesk?

Simply drop an RSC file in C:\GEMSYS\GEMDESK\RSC\ then click any file and
choose 'Assign Icon' in the MagxDesk 'Options' menu. You don't even need to
reboot.

This folder can cope with up to 10 different RSC files IIRC.

## 96. Help w/ 1040st and external HD

Newsgroup: comp.sys.atari.st
Date: 1997-01-02 00:00:00 UTC
From: melkweg@inetnebr.com
Message-ID: <melkweg-ya023580000201970032180001@news.inetnebr.com>
Source record: 130915

I have a 40meg external mac HD, and would like to connect to my 1040. Is there a standard cable that would work? What would be the best driver/editor software to start 'er up once I get a cable?
Also, I'm looking for the best way to download software from my mac, and transfer it to the ST. I've had some success after unzipping, and saving to a 800K DOS disk, but looking for a more reliable system.
I've hooked the ST to my mac with a null modem cable before, and it transfered ascii just fine. would this be a better solution for transfer?

Thanks in advance,
Mark

Hey there, I would like to set the record straight. Our policy for gemulator registration is now that everyone who bought one from Toad will have the info sent by us directly to Derek. I know I had in the past said that the cards were not here. If you have had trouble getting support from Derek, try again and he should have your info. If for some reason it did not work, send email to info@toad.net. Some times people fall through the cracks.

Out of the ether, the following was mentioned by Harry...:

HS> Not true. The MFP is connected externally through Modem 1 and Serial
HS> 1 on the TT (respectively Serial Port 1 and 2 of the chip itself,
HS> which is where the confusion probably is). The SCC is connected
Ok I stand corrected. Still I have never got a reliable highspeed download
through either of the Modem ports, perhaps something funny with my HSModem
setup?

SD>> I would therefore suggest using Serial2 in conjunction with
SD>> HSModem for your modem connections on your TT.
HS> It seems a matter of personal preference, going by the comments we've
HS> seen in the past, but for people like you and I with VME cards the
HS> decision is made for us ISTM.
Not necessarily so. ;-)

The cables to the two serial ports slip nicely underneath my Matrix TC1208e
card and rest behind the TT providing the serial ports still (though not as
neatly as before as they just hang out of the back now).

Spencer

## 101. Is there a List if Atari Shows for 1997?

Newsgroup: comp.sys.atari.st
Date: 1997-01-03 00:00:00 UTC
From: steve.2@pop.service.ohio-state.edu
Message-ID: <steve.2.3.32CC8E5A@pop.service.ohio-state.edu>
Source record: 130768

Well, First off I'd like to wish all a good New Year, and may all of us still get use out of our Ataris.

With that out the way, I'd like to know if there is a list or information on what Atari shows will be occuring in North America this year. It may be a bit premature to expect exact dates, but it will be helpful to know what months would be good to avoid so that we aren't stepping on larger shows (or they squashing our own).

ACEC, the Atari Computer Enthusiasts of Columbus, is thinking on putting on a bigger event than our annual swap meet for this year. So far it looks as if it will be in the fall, but there seem to be some bigger shows that also frequent that time frame.

Any good information (I'll look in the tabloids for nasty rumors) would be greatly appreciated. If there isn't a web page handy, I may just create one for this year with whatever data I can accumulate.

Thank you for your time.

Michael Steve jr.

k> the system cookie jar so I can run STiC and AtarIRC etc. where can I
k> find such a program?

You need JARxx.PRG in your AUTO folder. Call it JAR10.PRG - this will be big enough.

Have you had a look in the distribution archive? In my copy of WWW115 there is a JARxx provided.

I guess it's a SCSI drive if it's from a Mac. This will be OK on a 1040 but you cannot make a direct connection as with Mac - you need a host adapter (ICD adSCSI, Link etc.) between the 1040 DMA port and the SCSI device.

There is a great freeware driver around - CBHD by Claus Brod and Steffen Engels, check it out. v5.01 is the latest I've seen.

> 

I see no evidence of "popular experience" in this newsgroup concerning
problems with Falcon hardware. More Intel boards are returned in a day
at my local PC dealer that have problems than Falcon problems posted
here in the last year. Most software conflicts come from those who
think the Falcon is an expensive STE, which it is not. There is a
difference. What "experiences" are you talking about? The guy who
makes his own SCSI2 cable then smokes his board? The guy who connects
his IDE drive up backward and blows a chip? People desoldering CPUs?
People installing German hardware with only German Docs when they
only speak English? Sorry guys, I just don't see the problem. Maybe
I was lucky and purchased three nice one's. The point is the Falcon
is not easily upgradeable to faster CPU and bus speeds by the laymen.
Has anyone ever gotten 12mb of ram to work the the STE without the PAK?
How many have had problems installing a T-28 or T-36 in their ST?
Why cant I run GFA Raytrace on TOS 2.06? Why dosen't Speed of Light
or Doug's slick picture viewer for the ST only run at 8mhz? Wahaaaa!
I want it to run at 16mhz on my MSTE! That machine must be flakey.

I would hope that the "build quality" was designed into the Nemesis
before it went to production. I'm sure that the designers of the
Nemesis are well aware of problems that arise when trying to drive
chips beyond specification. If the Nemesis can operate at 24/24mhz
bus and cpu on all Falcons, it will have achieved it's goal.

Falcon owners with CPU's that were tossed back into the 16mhz bin because they couldn't qualify at 20% over 33mhz speed, but operate well at 33mhz will benifit from the option to run at 33mhz. Maybe even some will install a heatsink and fan and run at 48mhz, but probably not for long ;).

I don't know the designers, or have ever talked to them, but I would hazard a guess that a lot of the delay was making the board "compatible" with the A/B 040. It is only with this board and the Nemesis that the Falcon will reliably run at CPU speeds nearing 50mhz. Wizztronics tried, and it's looks as if they have given up, or ran out of money:). I was told that the A/B has not been tested at 48mhz because the 33mhz CPUs they have for testing won't run that fast. I have a 40mhz 040 that i'm poping in as soon as it arrives. It should be interesting to see how "flakey" the Falcon is then.

I like my story better:)

Mike

Hi there!

Brian Roland (bjr@edison.ebicom.net) wrote:
: Aloha,
: I'm looking for an ANSI "Outline" font for use with NVDI.
: Anyone know where I can get a TT or Spedo ANSI font?

I have asked this question in the past and it seems as though such a thing doesn't exist. The major problem would be for the shaded block characters that make up part of the ANSI character set. These are VERY dependant on the resolution one is using. To emulate pixel by pixel shading on an outline font would be difficult to say the least. I've a few bitmap ones that you can have if you wish...

Works great.

>Can they also be connected to a PC or only an Atari?

Only an Atari without a tremendous amount of work. Besides being
an asci interface they also use the Atari to format the page (no
internal memory to do page formatting as expected by the pcs.

>Can you still get cartridges for them and if so, approx. cost?

Toner and drum kits are still available - I think Toad still carries
them (I suspect you were asking mail order or local - in AU you can
find local dealer who can match them. There weren't that many
different engines used in laser printers.)

>
> Thanks in advance for any help...
I got it to work...try full compatibility with Backward, but 3 Mb, and you have
to do something to get the hiss out of the sound (I forgot which thing in
Backward takes care of that). It doesn't always run...but try it a few times
and you'll get it working (well, I did anyway).
It's too good a game not to be able to get it running on the bird...

## 119. GEMulator newsgroup in the making (probably)

Newsgroup: comp.sys.atari.st
Date: 1997-01-03 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.010397.150856.12@wxs3-3.worldaccess.nl>
Source record: 130786

There are plans to start a GEMulator newsgroup with accompanying FAQ. I am checking here to see if perhaps people are interested in this, and especially to ask if all GEMulator users who've had problems that they've also actually *solved* would please send the problem description plus a down-to-earth solution to my email address please. You will receive full credit, of course, and eternal gratitude.

Cheers,

>stos books.

See my sig for url, all the extensions you would want are available
from there,also plenty of support files, STOS diskmags and tutorials
and even manuals?
As for STOS itself, if you haven't got what you want then send me a
stamped addressed envalope and I will send you an original
copy...sorry no spare manuals, but the text on the STOS ftp site will
be ample enough:)

>ps. any recomendations on getting a falcon

Personaly I would love to be set free on a Falcon armed with STOS,
amazing things can be done with STOS<>Falcon :)

Cheers.............!ynoT

> Can anyone advise ?.

most unusual. :^)
SpeedoGDOS 4.2 was supplied with AtariWorks, and you should be have a manual
there. SpeedoGDOS is loaded from your autofolder. Outline(prg or acc -
rename at your convenience) controls the number and type of fonts loaded,
Drivers(prg or acc) allows you to load the printer drivers for your
particular printer(or closest one!)
have fun.fait fun!

> -Udo Stenzel

There are some DOS only alternative disk formatters that need to be loaded either through your config.sys file or autoexec.bat file. you will then be able to format and read various disk formats, including 11 track I believe. I have not personally tried this, but did use these formatters briefly on my 386.
good luck.bonne chance

## 128. Re: Atari SLM and the Mac (ST Computer)

Date: 1997-01-03 00:00:00 UTC
From: a1960563@athena.rrz.Uni-Koeln.DE
Message-ID: <5ajd3c$ck3@news.rrz.uni-koeln.de>
Source record: 130795

Hi Michael,

Michael Grove (mgrove@owens.ridgecrest.ca.us) wrote:

: I just got a copy of the Februar '96 issue of ST Computer.
: There is an article about utilizing an SLM on a Mac.
: I can make out some of the article, but it looks like
: there is a control module and harware interface that
: either needs to be made or purchased.

They connected the SLM to an Atari and the Atari to a Mac. The 0 modem cable connecting RS422 of the Mac with RS232 of the Atari has to be modified. On Mac side a HP Laserjet or Deskjet driver has to be installed, on Atari side the Diablo printer driver and an accessory called magicslm.acc.

The hardware part of it is explained in ST Computer issue 1/96 and includes graphics how to modify the cable.

Bye,

Kerstin

## 129. Cookie jar patch program

Newsgroup: comp.sys.atari.st

From: John.Kormylo@7861.conchbbs.com
Message-ID: <175_9701031051@conchbbs.com>
Source record: 130796

RAM_LEAK includes COOKIE.PRG, which will install a cookie jar on a computer which does NOT normally have one.

It can be ftped, but I don't know where.

I can send you assembly source code (it is very short), if you are interested.

>potentials, and quality.

I don't give a damn for future technology if it's not usable on my
hardware. It is not, even a 160*120 MPEG plays only about 3-4 fps.

So, our POVs are incompatible.

Yes, you can view them with CAB v1.42 and above :-)

But no program to make them yet :-(

The only program to make animated gifs is 'Gif construction kit' available
only for PCs :-(

Martin,

thanks for all the info. I'll look around for Gemview 3.16.

I have "spoken" to Adequate Systems via email and, yes, they are
expensive! Computer Direct of Canada is going to start importing
the modules and maybe they'll be reasonably priced. One module I know
they have lets you use NVDI printer drivers, but it costs ~$150 US.
Another is a true Posscript printer driver and EPS and PS importer.

Greg

## 142. Current Notes arrive today in California!

Got a big surprise today at the postbox.
Current Notes made it here to California
today. About the same size as usual, less
the Toad add's. ( I don't miss reading
about something I can't buy anyway:).
The Computer Direct Add is awsome.
Makes me feel like the Atari market
is just getting started. Systems for
Tomorrow is at a full page and B&C
Computer Visions is supporting the
mag as well. There are a couple of
dealers I haven't seen advertise
before too. Let's support those
who support this magazine.

Mike

## 143. Re: Gemulator 96 and TOS ROM Images

Message-ID: <32CDA1D3.2C9D@toad.net>
Source record: 130810

Everyone who buys Gemulator from Toad is automatically registered with Darek Mihocka electronically. You DO NOT NEED a regisrtration card to be registered. If there are any other problems with the service which we provided, we're happy to address them. Compatiblilty issues with your machine sound like your primary problem with Gemulator. I'd try it on another machine.

Dave

Forget it. MiNTnet and Linux use different ways to communicate via the
parallel port. The reason is simple : The PC parallel port supports a lot
more lines than the ST version. Thus there was no way for Kay to make it
compatible.

Cheers Peter

This is not quite right. There is a german hardware manufacturer that
almost finished development of an SCSI - Ethernet adapter. He also sells
ACSI - SCSI adapter. I've been told that the former does comprise the
latter, but I'm not sure.

Many people operate it this way !

It's also only true for now that Ethernet cannot be used with STiK. There
is work going on to include other interfaces (Ethernet too) into STiK.

Cheers Peter

With Linux it is different, as Linux is capable of IP masquerading,
something MiNTnet is not up to yet.

> I suspect that by assigning a non-existant IP address to your PC and the

Please do not do such things, it will always cause trouble to use
non-existant, non-reserved IP addresses. One day they will be used, and a
real mess will happen.

Cheers Peter

Don't know.
I do not have a Falcon at all. The Behne Brothers did the
Falcon-specific programming (IDE/DSP/Video), so I never
needed one.

## 149. Space Empire Elite Intergalactic?

Newsgroup: comp.sys.atari.st
Date: 1997-01-03 00:00:00 UTC
From: bochmann@kandel.ds.freinet.de
Message-ID: <5ahk3t$car@belchen.freinet.de>
Source record: 130857

Hi,

does anyone happen to know, whether there are any Space Empire Elite Intergalactic leagues out there? I've been playing in the NeST league for the last five years (or, rather not playing the last year or so, as I was quite fed up with always the same people and always the same trouble), so I'm looking for some change...

I would do almost anything, be it polling mail somewhere overseas, or set up an internet link, to join some new SEE freaks anywhere in the world. A longer time between two resets than one month would be great.

Rich,

Did you try another efnet server?

It could be that someone on your ISP broke some rules and they banned anyone from your domain. Its quite common on IRC. With most people having dynamic IP address's the only way servers can ban trouble users is to ban the entire ISP.

Someone on my ISP got our entire domain banned from the utexas IRC servers. No biggy. I just use another server.

A simple way to find it is by visiting the Hensa Archive. they always have the latest version of the program.
The address is not at hand because I've become a platform traitor--the PC is handier but will never replace the Mega for
MIDI.
Resend your question to comp.sys.atari.st and ask for the address. The Hensa archive is pretty comprehensive for Atari
SW and apps. The Usenet group is very very helpful for question and direction.

Out of the ether, the following was mentioned by rdupuy5596@aol.com...:

r> OK, The lessons are coming fast and furious now, I have had too much
r> time off for the holidays, I guess. Anyway lesson 2 gives an overview
r> of a simple C program.
r>
r> Check it out in comp.sys.atari.programmer and have a happy new year!
r>
r> p.s. If anyone needs a repost, just let me know.
I'm not knocking you or anything but this tutorial reminded me of a hardware project published in a computer magazine for an 8-bit machine many years ago.

It stated Exclusive Project inside to modify your machine and expand its capacity.

The article inside had you dismantling the machine and doing some soldering, etc. Then right at the end it stated that the rest of the article had to be held over to the next issue due to space limitations. The rest involved finishing off the modifications and putting the machine back together in a working condition (which it wouldn't do at that point).

I wonder how many annoyed readers got caught out at that point! ;->

Spencer--

This C tutorial is free and designed to get you started. Anyone who wants to learn more advanced subjects after this tutorial ends is free to continue with the many excellent resources available in everybookstore. In addition, comp.sys.atari.programmer has been around a long time and it is my hope (and belief) that advanced questions can be asked of the group at large and will usually find an answer.

I understand what you are trying to say, however, and I'm not offended. Everyone should be aware that I am not under contract and cannot make any guarantees. (Lesson 4 is in the works, however...)

I'm afraid that he is out of luck. Notator SL does not run on a Falcon even
with Backwards installed !!. Notator SL runs on any ST but not the Falcon. The
Emagic prg to use is LOGIC. A new version has just been released for the Atari
(v2.5). It may be possible to upgrade from SL to LOGIC. It certainly was a year
ago when I made the change from ST to Falcon

## 167. Atari ST stuff for grabs (UK)

Newsgroup: comp.sys.atari.st
Date: 1997-01-04 00:00:00 UTC
From: Chris Smith <bia19@keele.ac.uk>
Message-ID: <32CE166B.6540@keele.ac.uk>
Source record: 130718

I wish to dispose of the following hardware:
Atari SM125 hi res mono monitor;
Philips 8CM852 colour monitor.

Also the following books from the Abacus Atari ST series:
2 Gem Programmers' Reference;
3 Atari ST Internals;
4 Atari ST Machine Language;
8 Atari ST Peeks and Pokes;
13 ST Disk Drives: Inside and Out.

And the following software for the Atari ST:
GST Macro Assembler;
GST C compiler;
Fast Basic;
ST Doctor;
Fast Asm;
pc-ditto;
GST 1st Word Plus;
K-comm 2.0;
Elite;
Guild of Thieves;
Psygnosis Barbarian;
Psion Chess;
Star Treck - The Rebel Universe;
Hyper Paint.

Finally, I have a broken 520STfm available for spares or repair!

Offers/enquiries by E-mail to bia19@keele.ac.uk

>Try to rename to *.prg or *.tos (the usualy atari suffixes).
>Maybe it works.
>Is the emulator a software or a hardware release ?

The .atr files are disk images of old Atari stuff. They are used by
Atari 8-bit emulators, of which I recommend XL-it - it's the best
shareware emulator out there. It's available by link at Yogi's
Jellystone Park at
http:// www.blast.net/~scharles/

Good luck, and have fun!

>boards from Titan Designs?

David Encil from Titan told me the board is available for fitting from Titan right now but this will mean sending your Falcon to them. The manual isn't ready as yet and thats the reason why they are not sending the board to potential customers. You won't find Titan debiting your card untill you recieve the order neither!

I use Ghostlink but thats all I need because I have 2 hard drives attached
to my Atari Falcon. I have a program that will allow high speed transfers
using the parallel interface. I've forgot what the program is called and
havent tried it out as yet but understand all you have to do is make up a
parallel interface following the instruction in one of the text files and
away you go. I'll wire up one of these sooner or later. I have the
hardware but not the time... or get up and go ;)

I'll find the software and put it on my download page by the weekend.

The only two utilities that produced errors with MagiC after I cleared out
the rubbish from my Auto folder are START and WBDAEMON - Error -69. I
suspect it's other programs that are causing these to fail. All errors clear
when #_TSL is switched off in Magx.inf

## 180. Possible NEW Atari Magazine (USA)

Newsgroup: comp.sys.atari.st
Date: 1997-01-04 00:00:00 UTC
From: tj@oro.net
Message-ID: <tj-0301972144430001@i441.oro.net>
Source record: 130731

Would folks be interested in a new US based Atari 'ZINE.

I am just curious if there is still a large enough Atari user base that would buy the magazine.

Just send me a quick note if you would be interested in a printed magazine or 'ZINE that covers the Atari Systems.

If enough interest is there, it would sure be fun to get people back into using the Atari machines to the fullest.

It is my opinion that any computer on the market that can connect to the Internet is a very useable and powerful system. The Atari and the NET work well now so maybe some new life can come back into the old Atari.

Send me your ideas.

## 182. Cross-posts to alt.binaries.atari

Newsgroup: comp.sys.atari.st
Date: 1997-01-04 00:00:00 UTC
From: atari@teleport.com.REMOVE.TO.REPLY
Message-ID: <5al22n$jvp$1@nadine.teleport.com>
Source record: 130733
Cross-posted to: alt.atari,alt.binaries.atari,alt.crews.atari,comp.binaries.atari.st,comp.sources.atari.st,comp.sys.atari.st,ctdl.sys.atari.st,maus.sys.atari.software,rec.games.video.atari,stgt.atari

Recently, there has been a rash of cross-posted discussion articles in
alt.binaries.atari. I responded (as moderator) by gently reminding
everyone that the newsgroup is NOT for discussion, but only for
binaries.

In response, I received rude email from a maus.net user (or possibly
2). Thus, the following new policy is in effect immediately:

Henceforth, ANY AND ALL discussion articles cross-posted to a.b.a will
be summarily cancelled. Charter violations will be reported to the
appropriate system adminstrators.

I am deliberately cross-posting this warning to all the
previously-involved newsgroups. If people would simply read the
charter, it wouldn't have been necessary to intrude; to those of you
in the majority - that is, courteous and literate users - I apologize.
To the one or two of you (who know who you are, at fr.maus.de) who
are rude and arrogant, raspberries.

TOS error messages
------------------
message no. meaning of message
---------- ------------------
1 general error
2 disk drive not ready
3 unknown command
4 CRC error- disk checksum wrong
5 bad request
6 seek error- track not found
7 unknown media- bootsector wrong
8 sector not found
9 out of paper
10 write fault
11 read fault
12 general error
13 disk write protected
14 media change detected
15 unknown device
16 bad sector (verify)
17 insert other disk (request)
18 insert disk
19 device not responding

32 invalid function number
33 file not found
34 path not found
35 too many open files
36 access denied
37 invalid handle
39 out of memory
40 invalid memory block address

46 invalid drive specification
48 cross device rename (not the same drive)
49 no more files

58 record is locked - (file locking and network)
59 no such lock (unlock an unlocked record)

64 GEMDOS range error- seek wrong?
65 GEMDOS internal error
66 invalid executable file format
67 memory block growth failure

80 too many symbolic links
200 mount point crossed (indicator)

BOMBS and what they mean
------------------------

no. of bombs explanation
------------ -----------
1 not applicable
2 bus error (user does something the ST doesn't
permit)
3 address error (usually error in program)
4 illegal instruction (two prgs using same memory
space)
5 division with zero
6 CHK instructional error
7 TRAPV instructional error (usually ROM error)
8 conflict with a privileged command
9 trace vector error
10 line 1010 instruction- line 'a' error
11 line 1111 instruction- line 'f' error
12 not applicable, reserved
13 FPU protocol violation (TT/Falcon)
14 format error
15 unitialized interrupt vector
16-23 not applicable, reserved
24 vector 24 error (might be MC68901 and/or GLUE
chip)
25-31 auto-vector interrupts
32-47 TRAP exception Vectors
48-55 MC68881 FPU exception vectors
56-63 MC68851 MMU exception vectors
64-79 MC68901 MFP vectors
80-95 MC68901 MFP vectors (TT only)
96-111 Zilog 86C30 SCC vectors (MegaSTE/TT/Falcon only)
112-255 undefined

** A large number of bombs might be the total of several errors.

Is this an official or a patched version of AHDI? Years ago I had a look
at the code of the latest AHDI version and it wouldn't support two IDE
drives.

This is normal because up to HDDRIVER 6.1 the autoconfigure function
only supports ACSI and SCSI. Current versions of HDDRIVER also recognize
IDE drives with this function.

From: chriswil@southern.co.nz
Message-ID: <5al5t8$n0s@orm.southern.co.nz>
Source record: 130739

Hi there!

Andrew Holt (andy@aholt.demon.co.uk) wrote:
: How do you add additional icons to the icon file in Magic 5's Gemdesk ?

Not sure how to add them directly, but I assume MagiC 5 is like MagiC 4.
APPLICAT (as supplied with MagiC 4) can use icons from other icon
resource files. You can use icons from DESKICON.RSC (TOS 4.0x icon file),
DESKCICN.RSC (MultiTOS icon file), EASE.RSC (Ease desktop icon file), and
icon files supplied with a lot of newer software. Just copy any icon
files you want to use into the RSC folder used by MagiC (this is
C:\GEMSYS\GEMDESK\RSC on my system). To use the new icons just select an
icon you wish to change and hit ALT-I. APPLICAT will open its icon window
complete with all the icons from the new files!

The icon files can be edited with a program like ICDRAW if you want to
create your own custom ones...

Hope this helps...

Hi there!

Guido Vollbeding (guivol@esc.de) wrote:
:
: If you ever took the effort to study the MPEG
: technology, you would immediately forget
: about AVI, MOV, and other stuff.

It seems that AVI/MOV are compromise formats that negate the necessity to own an expensive computer that is actually fast enough to decode MPEG at a good enough quality. That is why you see some quite good quality AVI/MOV file playback on even slower PC/Mac machines, and only good MPEG playback on machines with an MPEG decoding chip built in or a fast CPU to do the math...

Perhaps another argument is that AVI/MOV represent a 'poor-mans' desktop video format. There are a number of 'poor-men' out here (me included!!) so perhaps AVI/MOV isn't such a bad thing after all for those of us who do not have the mathematical grunter required to do MPEG well...

Hmmm. This is not very gracious Guido. To be honest, if I have the choice between a cheap, easy, incompetent imitation format which works at a reasonable speed and the real thing running at 1 mile an hour, I will go for what looks best and leave the elegance of the compression algorithms to the techies.

I really think that your somewhat elitist approach to the subject (though technically well-founded I am sure) would have more substance if 1stGuide played mpg files at anything but a crawl...

Just my 2 cents worth. I would still like to see a decent mpg player for the TT...

## 195. CoSTa 1.51 available (date fix)

Newsgroup: comp.sys.atari.st
Date: 1997-01-04 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <92167239_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 130746
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Whoops!

It seems CoSTa is a bit unhappy with the New Year. It doesn't seem to like
1997 at all :(

All extracted calls are given the wrong date ie. 02/01/97 becomes 03/01/97!

I've corrected the date code, and the new version (1.51) is now available
from my web page (see .sig).

Just in case you don't know what CoSTa is: It's a call extractor/telephone
bill coster that handles NOS, ICE, MiNTnet, CixComm, STiK, ConNect2.
As reviewed by Neil Martin in the first issue of Atari Computing Magazine!

Regards, Gary

Mykle <mykle@con2.com> said:-

>After d/l Atari software thru a Mac the Atari gives me this message
>TOS Error # 35. Can someone tell me what this means?

Not sure what it means, and I have NO experience of doing this (hence absolutely NO guarantees and everything is at your risk...), but I do remember a discussion here some time ago about problems with files that had been downloaded on Macs. All the following is from memory:

IIRC the problem is that the Mac adds in something to the file header (the resource fork? - something to do with Mac icon management, and the reason why Mac files have to be binhexed to survive storage intact on non-Mac filesystems). IIRC (again!), the solution (at least in some cases) is to rename the file from the Atari desktop once you have it transferred over. You can then rename it back if necessary, but the process of renaming seems to sort out whatever got mangled.

HTH - might be worth a try anyway,
John

## 199. XURL 2.31 now available

Newsgroup: comp.sys.atari.st
Date: 1997-01-04 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <73394816_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 130750
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Just a short note to say that the latest version of XURL is available from
my web site!

Regards, Gary

XURL - The URL eXtractor
------------------------
XURL (pronounced ZURL) extracts URLs such as http:// from a file and
adds them to a html document which can be loaded into a browser.
The URL can then be clicked on and the browser will jump straight to
the given URL.
This means that you no longer have to write them down and then re-key
them into your browser. XURL makes it easy.

v2.31 04/01/97
New:
.Support for ftp:// and mailto: URLs.

.Ability to view the .html file in a browser (ie. CAB) immediately
after extraction. VASTART is used if the browser is already running
else it is launched via shel_write.
Full path to the browser must be specified in an environment variable
"BROWSER=" (see documentation).
Generic term of 'browser' is used, along with VA Start instead
of CAB protocol. Hopefully it will be compatible with both CAB and
Webspace.

.<HR> Horizontal Rule written to separate 'new' extractions from
existing ones. So you can see at a glance which are the new ones just
extracted. Thanks to Roy Goring for this suggestion :)

.Status bar now shows a realtime count of how many urls
extracted/ignored during processing.

.XURL now accepts a full pathname via a command line and uses it as a
default 'source' path. ie. dragging a file from the desktop onto the
xurl icon results in that file being defaulted into xurls 'source'
field ready for extraction.

.New 'About' dialogue which allows 'copying' of my email address/url
to the clipboard, ready for pasting into a relevant program.
Double clicking on the email address/url will launch it into a
email program/browser (see documentation).
This is going to be standard in all my programs from now on.
It's a bit gimmicky but hey, so what!

Bugfix(s):
.Bomb fixed if no filename or wildcards specified
(File selector code rewritten).

.Fixed the problem where a url is sometimes extracted with an extra <
at the beginning and therefore doesn't show as a link. (Hopefully)!

.extracted urls are no longer centred when displayed using CAB 2.0 or
Internet Explorer3. Header HTML changed in XURLHOME. To activate this
bug fix it will be necessary to delete/replace your existing .html
result file, so that XURL recreates it for you!

Frank,

Where did you read about building a serial port from the LAN port?
And will software recognize it as a serial port then or will I have
to write my own? Please email me if you can as it's sometimes hard
to find my original post when wading through the Usenet menu.

Thanks!

Greg

There is indeed a program that allows you to plug a serial mouse into
an ST's serial port... Problem is, there goes your modem port.

That program is on aaue somewhere...

It only stands to reason that where there's sacrifice, there's someone collecting the sacrificial offerings. Where there's service, there is someone being served. Make no mistake about it, the man who speaks to you of sacrifice is speaking of slaves and masters - and he intends to be the master.
-- Ayn Rand

---------- begin WAUG Flier attachment ----------

WAUG -- (Formerly 'The Washtenaw Atari Users Group')
(Now known simply as "WAUG")

What is WAUG? Over 12 years ago a few intrepid individuals decided to
============= start meeting regularly to share their enthusiasm and knowledge of computers and related hardware/software items. In June of 1987, after more than two years of unorganized and informal meetings, the members developed and formally accepted a club charter. Thus WAUG was born! Helping people get the most out of their computer is WAUG's purpose.

Initially, the club was dominated by Atari afficionados, however in June of '95 the executive board arranged to expand the club's resources to include IBM and Macintosh users. WAUG is an ideal place to meet with other persons who share your interests and to find answers to your questions about using your computer -- no matter what machine you own,

how old it is, or your level of expertise.

Who's involved? Since its inception, members from cities outside Ann
============== Arbor (including Westland, Canton, Livonia, Milford,
New Hudson, Dearborn, Hartford, and even as far away as
Toledo) have regularly attended the meetings. Some members live as far
away as central Michigan, and one member lived in Montana (!) and joined
simply because he enjoyed receiving our newsletter.

How do I join? Membership in WAUG has only one requirement: an active
============== interest in personal computers. Annual dues are $15,
for which the member receives free monthly issues of the
club newsletter, opportunites to win valuable door prizes, and reduced
rates on disks purchased from the club's Public Domain/Shareware disk
libraries.

What will I find? A different topic is featured each month: Printers,
================= Education, Telecomm & the Internet, Beginners Woes,
Desktop Publishing, Scanners, Swap Night, MIDI &
Music, and Utilities are typical examples of what you'll find when you
visit WAUG. Drawings for door prizes take place at every meeting, and
the annual Christmas Party Meeting is not to be missed. There is no
dress code in effect at any of the WAUG meetings -- tuxedos and ballroom
gowns are perfectly acceptable. (However if you choose to wear these, we
WILL stare at you!)

How to contact WAUG:
====================

WAUG
14 Payeur
Ann Arbor, MI
48108

Voice: 313/971-8576
Modem: 313/971-6035
E-Mail: molin@atari.archive.umich.edu
harvey@mail.ic.net
WWW: http://ic.net/~harvey/waug.htm/

or just show up at any regular monthly meeting! Visitors are
welcome and we promise not to pressure you to join until we've seen your
face at least three times!

Where does WAUG meet? Meetings are held regularly on the second Tuesday
====================== of each month at Colonial Lanes located on South
South Industrial St. (across from Kroger) between
Stadium and Eisenhower streets. Meetings start at 7:30pm and usually run
to approximately 10:00pm.

Message-ID: <5amags$584@ratatosk.uio.no>
Source record: 130759

>You may hold that opinion if you like, but I'd suggest popular experience
>indicates the opposite.

None of the Falcon owners I know have complained of "flaky" machines.
There was one case of an unstable machine, but the culprit turned out
to be the Wings memory card.

>You'll already know from Doug that a good summary of the reasons for the
>delay in shipping Nemesis is that they were increasing the build quality to
>such a level that the inconsistencies from one Falcon to the next were
>finally overcome. I think that tells its own story, don't you...?

It tells me the Nemesis team are doing a thorough job with their
product, for which all Falcon owners will be greatful.

Anyway, I'm surprised you feel this way about Falcons. How did you
get this impression - have you owned a very bad one?
When you say that you "wouldn't have one at any price" (hey, it sounds
like you're talking of pc's) I think you'll miss the chance of using the
best computer Atari ever made. It's a joy to use, and with the arrival
of Nemesis it seems it'll get even better.

Give the bird a try, Harry - I don't think you will be disappointed :-)

- Petter -

No, Toad is not the ONLY company. Computer Direct is pretty well
exclusively devoted to TOS and MagiC platforms. Toad is hyping their PCs
(with Gemulator built in) and their Internet service provider business.
They still sell Atari stuff, and provide support, but appear to be
winding down their involvement in the world of TOS computing. Computer
Direct, on the other hand, will only sell you a Mac or Mac Clone if you
REALLY insist, and steadfastly refuse to have anything whatsoever to do
with PCs. Check them out at http://compdirect.com. They are doing some
really amazing stuff.

Bill Merik
VERY satisfied Computer Direct customer and beta tester.

## 212. CoSTa 1.51 available (date fix)

Newsgroup: comp.sys.atari.st
Date: 1997-01-04 00:00:00 UTC
From: gary@the-gap.demon.co.uk
Message-ID: <69065200_000003_OASIS_NEWS@the-gap.demon.co.uk>
Source record: 130763
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Whoops!

It seems CoSTa is a bit unhappy with the New Year. It doesn't seem to like
1997 at all :(

All extracted calls are given the wrong date ie. 02/01/97 becomes 03/01/97!

I've corrected the date code, and the new version (1.51) is now available
from my web page (see .sig).

Just in case you don't know what CoSTa is: It's a call extractor/telephone
bill coster that handles NOS, ICE, MiNTnet, CixComm, STiK, ConNect2.
As reviewed by Neil Martin in the first issue of Atari Computing Magazine!

Regards, Gary

>input files. The word 'GIF91' is mentioned somewhere but what the heck
>creates GIF91 on our platform??!! ;-\ Sadly I think that GIF87a files and
>GIF89 files are unable to be used with this program...

I've tried this program, too, with similar lack of success (though I'm using a humble STE rather than a Falcon). I've tried both Simon Yardley's version (which he said he couldn't get to work properly either) and the version on CNAM which seems to be newer and has a helpful readme file telling you what you need to enter on the command line. There is also a web site which gives you more information, but be warned: CAB crashes when trying to show one of the pictures so I'd turn images off before visiting. It's at:

http://www.iis.ee.ethz.ch/~kiwi/GIFMerge/

One of the things it suggests is to *not* use GIF89 files with interlace or transparency as input files, but to stick to GIF87 and set transparency in the command line.

I need to make it clear that I am *not* criticising either of the programmers trying to port this over, it's just that it's in need of some tweaking. :-)

Also I am grateful that someone is working on this as not having a Falcon I can't use M-Player for the job.

I *did* manage to get it to produce one working animation which had all of two frames which switched every half second. Wow. Here's a brief rundown of my experience, which might help anyone else who wants to use it with its current limitations (!):

1) The program (a TTP) will not work properly from the desktop (at least Magxdesk and Thing). For some reason it tries to interpret the > used in the command line to separate the names of the frame GIFs from the name of the output file as a filename character and complains it can't find the file to process. You have to use a CLI to get off the ground. This applies to both versions. I haven't got a SingleTOS CLI so I haven't tried it, only MiNT and MagiC.

2) It hates MagiC: it seems to run OK from the MagiC CLI but it corrupts some frames and in attempts at longer animations complains of an EOF in the data stream (?? End of File??). Same with both versions.

3) The CNAM version produced the working animation mentioned above when run from tcsh under MiNT. However on the attempted longer animation (hey, *eight* frames...) it fell over as above, with the same complaint.

4) Something is wrong with the switch for setting the delay between frames in both versions: Simon Yardley's version runs OK if you use it but the output GIF can't be read by CAB. The CNAM version crashes with a bus error no matter which OS or shell you're using. Upshot of this is you are stuck with the default delay of half a second between frames, which is next to useless for most things.

5) After spending quite some time with the above I gave up so I haven't tried the other parameters out. They may work OK!

Anyone else had a go and found workarounds?

HTH
John

>The drive however is formatted, partitioned and all (by ICD tools).

Newer quantum drives need scsi arbitration turned on in the software
before they will be recognised by the atari.. afaik AHDI doesn't
support this.. ICD seems to recognise them anyway.. Basically you need
a new driver software which is AHDI compatable.. Eg hddriver, Scsi
tools, or maybe that other one which name I cant remember atm... :)

Nick.

Hello,

The Radical Race Demo, a new game for Falcon 030 is available on
ftp.cnam.fr or on THE BBS (see below). The final version is available,
call Logitron (see below).

File RRDEMO.ZIP, size ~ 623 ko

The Game:

- 1 to 2 players
- 2 play modes and training mode
- normal fire or automatic fire mode
- Up to 9 cars on race
- Car improvment
- 16 various race (sand, town, bridges...)
- Supports VGA and RVB monitors
- Required 4Mb Ram, make the most of 14Mb.
- Controls by keyboard, joypad, joystick
- Resolutions: 640*480 256c, 384*240 TrueColor (bigger play field).
- 50 frames/sec in TrueColor mode
- Music and sounds (12 stereo panoramic voices)

Distribution:

LOGITRON
30, Avenue Division Leclerc
92310 S�vres
France - EC
Tel/fax: +33 1 46 23 13 51

Regards.

Point of THE BBS: +33 (0)1 42 51 11 35

SO Frank, Is it working for you.
How have you got it set up.
I've tried both irc-client.demon.co.uk and irc.demon.co.uk.
None of them work.

May I ask what you use and how I may get mine working again/

James - Have you got it sorted yet?

Stuart

> : to the Atari laser.
>
> More info please !!!

Well,

it is an accessory ("MAGICSLM") that reads the hp-pcl data from the
serial port (or a file) and converts it into an .img file or prints it
directly to the SLM printer via the diablo emulator software.

We only support the raster modes, not the true type font modes. So it
works fine with the hp drivers of the Mac or the hp drivers you could
use with MagicMac. I gave the program to some people to try it with PCs,
but didn't get an answer so far. It probably depends on the driver and
the windows program...

Our program was published in a german ST print magazin. It is available
via email.

Harald

## 226. Magic PC and drive U:

Newsgroup: comp.sys.atari.st
Date: 1997-01-05 00:00:00 UTC
From: mark@mdsh.com
Message-ID: <32cefbef.3569324@news.idiscover.co.uk>
Source record: 130676

I work sometimes on my Falcon with MagiC 5, sometimes on my PC with MagiC PC and sometimes on a friends Falcon with MagiC 5.

I carry around a Zip disk between these computers with my default setup.

On the two Falcons we have an fsymlinks of the Zip drive as U:\zip which works very well; I can work on my Falcon where the Zip drive is N: or on my friends Falcon where the Zip drive is H: and access all the programs I require through U:\zip\

But drive U: does not seem to work that way under MagiC PC.

Creating a fsymlink in drive U: under MagiC PC does not work.

Under MagiC PC _none_ of the drives are available in drive U:, only DEV, PIPE, PROC and SHM.

Is this a bug in MagiC PC, or am I doing something wrong?

Thanks.

Enjoy! Mark Himsley.

## 227. Cannot delete files..

Newsgroup: comp.sys.atari.st
Date: 1997-01-05 00:00:00 UTC
From: bili6745@mach1.wlu.ca
Message-ID: <E3IIt4.50@info.uucp>
Source record: 130677

I've been trying to rid my hard drive of corrupted files with illegal names.
I cannot delete these files from the desktop nor can I access them (but I
can see that they are there and that they take up space.)

I was able to remove ones from a boot directory using chkdisk3 that came
with my falcon. Diamond Edge removed some of the other files that had
illegal names with characters such as '

my problem is that I have corrupted files in subdirectories (usally contian
a lower case letter) that I cannot delete.

Is there a program that I can use to help me delete these ugly files?

Thanks alot,
Keith

Harry Sideras (hsideras@mettav.demon.co.uk) wrote:
: t> I think it's high time the net community said "Enough" and stopped
: t> using GIF. Consider PNG instead (http://quest.jpl.nasa.gov/PNG/).

I guess I started the original thread awhile back. I solved my own little problem (tons of help from others), by printing to disk (from within Pagestream) using the IMG.PRT driver with 300dpi selected and then converting the IMG file to GIF.

Recently a friend of mine (very computer literate) told me that many PC users may not all know that they need to "fit to page" to keep the approx 300dpi printed resolution when they send the GIF to the printer from within their viewer programs. They might reduce the resolution so they can "see" the document on screen before printing and thus losing the 300dpi printed resolution. Although, if they print from with their web browser, then they may not have to worry about this.

GIF if not really a very good choice for sharing documents "across platforms". Adobe acrobat would be a good choice. Never heard of PNG. Wouldn't it be nice is the PC world were all on the same page!

Source record: 130680

This message from chrisc@zetnet.co.uk to All came in on a wing and a prayer...

Hi Chris!

>> a> Does anyone know of any PCB layout software for a Mega STE?
>> a> I would love to get a hold of a demo if possible.
c>
>> You need to look for PCC_DEMO.ZIP or SCOOTER.ZIP. Both are very good
>> PCB design programs but are in German only. I don't know of their ftp
>> addresses
c>
c> I thought I'd add my thoughts on this matter as no-one else seems to
c> have mentioned the following trio of programs. First off Multi-layer,
c> main problem is it's all in German, and the German-2-English
c> translator programs, even supposedly technically oriented ones, came
c> up with a particularly hilarious, if completely unusable, translation

(g) that's always the problem with a word-for-word translation, also the terms used in PCB design probably don't appear in the dictionaries!

c> of it's documentation when I found its demo on a CDROM. PCBoard
c> Designer wasn't bad, but restricted itself to Eurocards as far as I

I've got this prog, but unless it has been updated since there are no drivers for HP printers unless you use one of the 3rd party progs, none of which allow you to adjust the pad size which is minute as it stands. I find myself using Myeck's IMG converter and editing the file myself, not ideal but OK for small projects.

c> can tell. Platon looked the best of the three demos I saw, easy to
c> use (very GEM) to the point where you hardly needed the manual at

German and French demos at ftp.cnam.fr for anyone who wants a look, filename something like Platine.

c> all, it did photoplotting on a huge range of plotters, and given you
c> can pick up an HP7475A for less than 100 UKP you could probably
c> justify getting one purely for PCB use, it also did Gerber/NC output,
c> its only problems are it only supports two-layers plus two screens,

For the hobbyist that's probably more than you could want, there's no way that I'd like to work on anything other than a single-sided board! (g)

c> and it isn't available anymore. That said, Goodmans, the software
c> people, have promised to try and get the rights from the original
c> publisher. It used to cost about 300 UKP, but so did Technobox
c> Drafter, and that now costs 25UKP from Goodmans. If they manage to

c> get it I'll be at the front of a queue waving a cheque at them.....

Interesting, Goodmans seem to have their act together. Keep us informed if you can, in the meantime Scooter will print PLT files as produced by Platon I'm told.

Speak to 'ya later!

Source record: 130681

This message from julian@connexus.apana.org.au to All came in on a wing and a prayer...

Hi Julian!

j> Is anyone using an SLM laser printer?
Yep, an SLM604.

j> Can they also be connected to a PC or only an Atari?
No, not easily if at all. It might be possible to rig something up using a serial port link from the PC to an ST used as the necessary printer buffer, but it wouldn't be easy.

j> Can you still get cartridges for them and if so, approx. cost?
If it's an 804 you'd be better scrapping it IMHO.

Mannesman Tally MT906 drums/toners fit the 604 and even have the drum counter module (apparently).

Speak to 'ya later!

: > only for PCs :-(
:
: Not! There are lots, for PC, Unix and Mac machines. I think someone (I
: forget who) is working on an Atari port of one of the cli-based UNIX utils

Yup, it's called GIFMERGE...

I have tried it and been unsuccessful at creating an animated GIF. I have rendered 36 frames of an image with POVray, with each frame doing something slightly different and the movement cycling thru the 36 frames to create a repeating animation. I have then used GEM-View 3.16 to turn the rendered TGA files into GIF87a files, and tried to create my animation from those. GIFMERGE barfs at the 3rd or 4th frame with your atypically confusing UNIX alike error that DOESN'T help out... :(

The documentation needs to point out exactly what kind of files to use as input files. The word 'GIF91' is mentioned somewhere but what the heck creates GIF91 on our platform??!! ;-\ Sadly I think that GIF87a files and GIF89 files are unable to be used with this program...

Source record: 130684

In a message dated 1-1-97, Dennis McGuire said:
|
| You can also use a PS/2 (bus) mouse in the regular mouse
| port if you change the connector on the mouse from a 6-pin
| mini-DIN to a DB-9F.
|
While it is true you can use a PC bus mouse rewired with the standard DB9 connector on an Atari ST/TT/Falcon, PS/2 mice and bus mice are NOT the same item. PS/2 mice are readily adapted to serial use by a simple adapter (like the one I use on my PC everyday). Bus mice can be identified by the greater number of pins they use on their mini-DIN connector (vs. the 6 pins on a PS/2 mouse).

Source record: 130685

Hi there!

Tom Brammer (question@tbag.org) wrote:
: of using a falcon or st (i'm not being snide) i really want to know.

Compared to an A1200? Ummmm...I'd better keep this civil!! :)

I'll start with the Falcon (since I own one!)

The Falcon is hard to beat in a couple of areas. The first and foremost of those is music. With a Falcon and the correct software you can create a recording studio in a computer case. Typical is the ability to control 64 channels of MIDI at the same time as playing back or recording greater than CD-quality-sound on 8 or 16 channels. The cost of doing recordings of this quality is not cheap, but Falcon is easily cheaper than any PC or Mac music setup of equivalent power...

The other area I reckon a Falcon is hard to beat is with animation. This is mostly due to one or two pieces of software. APEX media is an animation/editing/drawing/filtering/morphing/etc... package that is probably the single most powerful piece of software written for the Falcon. It uses the inbuilt DSP processor found in all Falcon computers to make extremely short work of many graphics rendering tasks...

The DSP chip itself can perform decoding of JPEG images as much as 100 times faster on the Falcon, than you can perform the same operation on a standard Atari ST. It also handles MPEG playback, realtime audio sound-effects (like reverb, chorus), and can be used for anything the programmer desires (just has to code the thing!)...

The supplied (in ROM) OS that comes with the Falcon is not perhaps as comprehensive as the Amiga Workbench, but is very fast in operation. You can also buy MagiC OS or get MiNT/MultiTOS to allow seamless pre-emptive multitasking (MagiC is by far better here)...

Hope this helps...

"Yes, absolutely," replied faehnle.3@osu.edu.
Steven moved forward, and whispered something.
f3> Organization: The Ohio State University

f3> I just purchased a copy of Magic 5 and remember seeing a discussion
f3> on the location of the Magic Apps folder. Could anyone sum up the
f3> conclusion to this
f3> discussion for me?

The apps folder is a folder in which the programs in it are started automatically when MagiC boots lioke the Auto folder except that these are GEM programs launched in parallel. Programs that can be plaxced in here include, STart me up, appline, CLOCK, on your magic disks and WBDAEMON again on the magic disks.

If you look in the file MAGX.INF on your C:\ drive you'll find a line like this.

#_APP C:\GEMSYS\MAGIC\START\

The path indicated here is the APPS folder, it can be anywhere you like.

See you earlier,

Steven

Check out my Updated Atari Catalogs and find More Atari stuff! I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! And for the Atari ST & newer Line of Computers We have updated the ST Catalogs most of all the ST Software Catalogs. Catalog updated and more Software Titles added such as Brand New copies of Ultima V for those of you fanatic Ultima Collectors for the ST & for those who like Battling in Mechanized Combat, their's BattleTech, OGRE & OMEGA! And for those of you with more productive things on your Mind, PrintMaster & PageSTream!

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking. And something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Also, on BSC's Home Page! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Page with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Page. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.
--
Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

## 244. help with atari 520ST and Mac...

Gulp! SCSI-ports!!

Why not use the serial ports? This route is well tried and tested. Null-modem
cable and a terminal prog. each side.

Roger

## 245. Problem: Quantum F-ball 1.2 > Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-01-05 00:00:00 UTC
From: Istvan Leelossy <istvan@innet.be>
Message-ID: <32CF863E.4A41@innet.be>
Source record: 130695

Hye!

My falcon wont recognise a Quantum 1.2 Gig which I installed. As disk
0. The only drive apart from a 850Mb eide inside.
Whatever I do, AHDI 6.06 won't see it during boot up. ICD tools will,
but Cubase wont deal with it.
'Non AHDI-compatible scsi driver' or something to that end.
The drive however is formatted, partitioned and all (by ICD tools).

Anyone can help?

```

Hi Keith,

There are 2 approaches that I have used (doubtless there are others). Both can use Diamond Edge if you have it (I am going off it myself - one too many trashed partitions).

1. Move all the files you want to keep to a different partition, zero the damaged one using d-edge and then copy the good files back.

2. Use a sector editor like DADE or Knife-ST to change the illegal file name in the FAT table to legal names and then delete them normally.

On balance, I would recommend approach 1 as being quicker and easier if you have the disk space...

Hope this helps,

Hi Keith,

Have you tried the wonderful Kobold ?
It handles everything and as long as the file had a valid entry in the
FATs should be able to remove it.
Kobold is commercial and worth every penny/cent, but I believe a demo is
around on some sites.

Regards,

Simon

Yes I've seen it around and believe it works with all Atari's but having
DMA sound is better, i.e. an STE,TT or Falcon.

Have you got access to WWW ? You could search through on www.yahoo.com
and that will surely drag something up.
As the sources are public (I think anyway) there has been a few
incarnations ...

CAB 2 is not available, so you won't be able to get a copy of it from
anywhere. It is still in very early beta test stage ATM.
So you'll have to make do with CAB1.5 for now :)

## 250. Atari used in skiing resort! (Switzerland)

Newsgroup: comp.sys.atari.st
Date: 1997-01-05 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32cfcf641badb91@sn.no>
Source record: 130700

Well, I'm back again- so happy new year to you all!
Spending 2 weeks in Switzerland where my sister lives I got to go skiing in the Alps as well (lucky me!!)...

One of those days I went to a skiing area in the Bernese Oberland called the "Eiger, Mï¿½nch & Jungfrau top ski region", starting off with a lift called the "Mï¿½nnlichenbahn"- where I also bought my skiing ticket.
... and much to my amazement and joy I saw that they were using Atari computers there!!!! :-)

They were facing me from the rear end, so I couldn't exactly tell what kind of machines they were, but they looked like MegaSTE machines or TTs.
(I haven't used either, but from looking at pictures of them they look very similar...?)
Anyway, there were several of them in that office, and I could tell they were connected in a network by looking at the LAN connector on the back of them. I asked the woman selling me the ticket about them, but she knew nothing about them.

I'm sure they were Ataris since the word "Atari" was moulded into the plastic of the monitor's back-side. What kind of monitor could this be? The usual SM-124 just has the "Atari" printed on a sticker as far as I can remember.

Just had to tell you guys this as I thought it was quite nice to see the computers we use every day in professional use!

d> Problem is, I don't think serial2 has the line needed for auto-
d> answer. Also, I
d> have never been able to get 115200 or more on serial2 or modem2.
Well according to Stalker (possibly not the best indicator though the only
one I can think of at the moment) the serial 2 port is completely standard
apart from a lack of hardware flow control.

So its got Data Carrier Detect and Data Terminal Ready lines which would be
ok for autoanswer would they not?

d> Maybe there is a hardware mod...
I've no idea. Having had no need for AA I couldn't comment. However if the
Serial 2 is lacking in some manner for autoanswer couldn't you set the modem
in question to handle autoanswer (switch 5 is up on Couriers) so it just
sends a reponse code through to the TT for it to handle?

Hi,

about 1 year ago, I had asked a question about connecting
an SLM-804 printer to a Windows based PC. (using the Atari ST
as a intermediate). I received a reply that a German magazine
had 2 issues devoted to this and that it was done successfully.
Unfortunatly, I lost the issue numbers and was unable to obtain
the issues (which are in German). While I don't know German I
do have a friend who is willing to Translate the entire article.
If someone has these issues or can tell me how I can obtain
them I'd be more than happy to post them in English (after getting
an o.k. from the magazine ofcoure). Hope to hear from someone !

>you have real computers or nintendos for sale in this group. I say that
>Atari made real computers and I bought them as such and will sell them as
>such when the time comes.

I need to correct you in that you may TRY to sell your Atari for any price you wish to ask for, but finding a sucker to pay it is another matter altogether. I can go to local electronic discount resellers(USED) and find 1040ST computers stacked in bins for $30 to $50 each depending on condition. If you purchased your computer thinking it would hold its value like a fine collectable, you are VERY mistaken. Computers lose their value almost as fast as the ice-cream cone you purchase from a street-side vendor on a HOT summer day. If I constantly thought about what I have paid for hardware and what its worth now. I would NEVER buy another computer again...

Reni,

I have found that Systems Solutions is slow to reply to email also. I suggest getting hold of a UK magazine, such as Atari Computing, findout the price for Extendos and then mailing in an order. They take credit cards, I think, so you'll be protected there. If you don't want to do that contact chris@compdirect.com (Computer Direct, Canada and try to order from him. He seems to check his email 7 days a week so he'll likely answer quickly.

Greg

You have your ovl's and the likes in the modules dir, isn't it?
If so just copy the cab.ovl (I suppose you use the cab-for-mintnet
overlay) to the same place as the cab.app
Geneva seems to have problems to find some files if they are placed in
a different dir

Hopes this will help.

## 264. Oasis 2.10 problems revisited

Newsgroup: comp.sys.atari.st
Date: 1997-01-05 00:00:00 UTC
From: Simon@husbands.demon.co.uk
Message-ID: <852489258_OASIS_@husbands.demon.co.uk>
Source record: 130714
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

Hi to all.

I'm having problems with Oasis 2.10. I love V1.35 which I have used ever since I made it onto the 'Net, and was excited at the prospect of Oasis2. I registered in advance, paid money, everything. Oasis2 came out. I had problems. Couldn't use it. The authors told me to wait until 2.05 cam out. i did. When it came out, I couldn't use it. I waited until 2.10 came out. it has. And I can't use it. So is there anyone out there that can help me? Please?

I have a 520ST upgraded to 2.5 Meg RAM TOS 1.2, with System Solutions 170 Meg HD booting from HDDriver v3.7, then using Superboot V7. I am running everything clean to try to get Oasis2 working. These are my problems.

1) Once in Oasis2, I can't get out. The Exit commands cause the mouse to vanish and the computer to freeze.

2) If I try to call ICE or the OASIS editor, it tells me it can find them on Drive I. Why is it looking on drive I? I have all the OASIS stuff on Drive C. Anyway I moved the needed files to drive I where I put them in a folder called OASIS2 and these programs come up OK now.

3) ICENET2.PRG just doesn't work. Period. It starts up then freezes with a menu bar across the top.

4) I configured ICE.NET by hand to try to get it going. I can now log on. ICE is called and goes into it's thing, dials, and I get connected. Then all I get is 'IP:Bad checksum' coming up every second until I have a long column of them on the screen. Then the modem hangs.

These are my primary problems. There are others, but I won't go into them.

I am coming to the conclusion that OASIS2 just won't work with my version of TOS. Am I right? Or are these common complaints?

Can anyone help me? Or should I just give up? I'm a little frustrated, especially as I preregistered over a year ago.

Thanks for any help!

Simon

Hi,

An ICD Link II would be the "cable" you need. It is more than just
a cable though. It is a SCSI host adaptor as well. It allows your
Atari's ACSI port to talk to the hard drive's imbedded SCSI interface.

It should be noted that some models of SCSI drives are not useable
with the Link II. If you can send me the info on the drive, I can help
determine the suitability for this solution.

As far as driver software goes, the Link II comes with software which is
not bad, pretty good actually. The best software to use in my opinion
is HD Driver.

If you have any further questions or need help determining whether or
not this particular drive is useable, drop me a line!

All the best,
Chris @ Computer Direct

Subscriptions are a tough battle. So many North Americans have been left hanging by unfilled subs that they really don't want to waste more money.

We currently have 30 prepaid subs to Atari Computing and I expect it to grow to 60 by March. Still, this is not much. Mind you the cost of bringing over a UK mag is quite high and this may reflect in the low subscrips.

We charge 11.99 Cdn. for Atari Computing with disk.

All the best,
Chris @ Computer Direct

## 273. Re: Making Animated Gifs [Falcon]

Newsgroup: comp.sys.atari.st

Source record: 130633

We use a Freeware package called Gif Builder for the Mac. It runs under Sys 6 so therefore should work well enough to build animated gifs under Mac emulation, Spectre.

I have a cool new look to my site now that CAB supports animated GIFs, it should be up in about a week! Also, CAB now supports client side image maps, this makes navigating by image map much faster since the map info is held in the browser and not a cgi script on the server.

I will also have a cool new Atari desktop point and click navigation map on our web site in the next release.

Check it out!

All the best,
Chris @ Computer Direct

:
: I was unable to get into umich, but I could not find it at any of the mirror
: sites when I looked on January 2. What directory is it in?

I was unable to get in with ftp or WWW access. I did get in with gopher
and grabbed what I needed. There is a bug or two in this version, the
major one being the overwriting of the current sort option that is
displayed on the menu bar. The clock seems to overwrite half of that word
(if you are using sort by 'NAME' you only see 'NA' on the menu bar).
Another bug is when you go to turn the clock off. When you click on the
popup and select 'Off', gobbledegook appears in the Stewart dialogue box.

I'm sorry, I mixed up a few things here. The modem 2 ports are identical
for TT and MegaSTE only if the standard SCC master clock is used. If the
RTxCB is used as the clock source the ports are different in achievable
speeds. I know the TT feeds it's TT-MFP Timer C output into this pin, but
does anybody know where this signal comes from in a Mega STE ?

Cheers Peter

Does anyone know if the bug in the demo version of papyrus 4 that prevented it from correctly loading jpegs with a nova graphics card has been fixed in the actual release? I currently use version 3 on my TT with the nova card and would like to upgrade to version 4 for the purpose of using color. I can see no sense in doing this if the bug that prevents it from working with the nova card still exists. I received no answer when I e-mailed HiSoft.

Can anyone help?

Matt Faehnle

## 287. Deskjet 540

Date: 1997-01-06 00:00:00 UTC
From: faehnle.3@osu.edu
Message-ID: <5ar5ea$hsm@charm.magnus.acs.ohio-state.edu>
Source record: 130647

Do any drivers exist for the Deskjet 540 for pagestream? It seems that with every program I buy, every other HP printer is supported except the 540. This printer is capable of color printing and I would like to take advantage of this capability. Any help?

Matt Faehnle

I have same problem with my Quantum Fireball IDE 1.28 GB HD.

First I have problems for recognise Quantum at all,
I get over that when I formatted it with
AHDI (6.06[1?]) HDX Software.

Second problem was to get it partitioned, AHDI didn't
work for that so I tried HDDriver (3.5), no luck with
that. Finally SCSI Tools Jr made it.
Now it is partitioned for five ab. 250MB partitions
and it seems to work ok.

As a normal Hard disk driver I use AHDI 6.06[1].

>
>Musically,
>Terry Cano
>
>--
>Musically,
>Terry Cano
>

As I've been wandering around the net looking at Atari-related music stuff I found the following URL related to CSound :-

http://www.leeds.ac.uk/music/Man/C_front.html

I did download the manual and had a cursory glance, but decided it was'nt for me until I upgrade to a Falcon!, but I'd be interested to have some more info or speak to some one actually running the software on any Atari platform.

Another interesting page of links for Atari musicians is Peter's midi page:-

http://www.frisbee.net.au/~peters/midi.html

Lots of groovy software and links to other pages.

That should get you started, but if you need any more URL's or want to chat - feel free to e-mail me.

Regards,

I have a zip file that contains three different colour deskjet drivers -
colour deskjet, deskjet 500C, deskjet 550C. Hopefully one of them should
work. The file is at:

http://apb25.emma.cam.ac.uk/hp/pgs/dj_pgs.zip

I had the same problem when I was sent a fireball, apparently it
needs Bus Arbitration which ICD & AHDI don't support, HD Driver
however does, I'm sure Uwe will be along any second to confirm or deny
what I say :-) I didn't have HD Driver when I was sent the Fireball
so I returned it and was sent a Maverick instead, if this isn't an
option then HD Driver is likely to be your only hope.

On 5 Jan 1997 23:35:49 GMT, avrisham@beitza.jct.ac.il (oded avrishami)
spaketh thus:

>Can someone please tell me : is there a way to transfer file from
>atari to pc & how ?

Pretty simple to do.

1) Format an Atari DD disk on the PC - MUST be set to format at 720k!
2) Disk can now be used on both PC and Atari ST.

By using the PC formatted DD disc files can easily be saved by the
Atari and read by the PC (and the other way of course).

Remember: DO NOT try to use a PC HD disk on the Atari.

Hope this helps.

>I couldn't use it. I waited until 2.10 came out. it has. And I can't use it. So
>is there anyone out there that can help me? Please?

Sorry I can't help you as I never has been able to use Oasis 2.x
myself. I've tried to use the latest version but I ran into some
severe problems.
For instance trying to change the diplay in Oasis give me when I
click on the OK-buttom "access denied" and trew me back to the
desktop. The same happens when I try to change the preferences. The
display options from Icenet looks very messy. And the whorst of all I
still get the bad PPP-packet message if I try to log on. These are
just a few things that crossed my mind right now. There are a lot
other problems.
For me it is still unusable.
BTW: I'm doing this on a TT030 4/16, TOS 3.06, Thing 1.09, Freedom 2,
NVDI 4 and HSMODA 7.

>Can anyone help me? Or should I just give up? I'm a little frustrated,
>especially as I preregistered over a year ago.

The same overhere.
When shall we get a really working version?

# 297. Re: Possible NEW Atari Magazine (USA)

Newsgroup: comp.sys.atari.st
Date: 1997-01-06 00:00:00 UTC
From: publish@zetnet.co.uk
Message-ID: <5as3ct$1s4@irk.zetnet.co.uk>
Source record: 130657

Hi all

>15 US subs? That really depresses me!! I would bet there are nearly as
>many subs from here in New Zealand!!

There are! :-)

>What is wrong with you Americans?!
>Just because Bill Gates lives next door doesn't mean you have to abandon
>your Atari and go adding to HIS retirement fund!! (I would think that
>enough money already exists in Mr.Gates retirement fund)...

I'm not sure if I am right in saying this, but I would hazard a guess that many Americans are simply not used to dealing with companies or individuals outside the states. I don't think it's anything more than this. But the same goes for us Euros, we tend to buy locally, or from another EU country.

But seeing that Atari users are all over the world, there's no reason why we can't share information and help each other, much like what already happens within this group. Rich Tietjens took on the risk of importing and distributing Atari Computing to the states, and I think he deserves full credit for this. It's just a shame that the amount he takes is not so large, but this can be easily put right!

AC is a magazine for Atari users, wherever they are. It's written in the English language, so is understandable by just about everyone. It's obviously very UK-biased ATM, simply because that's where two thirds of the readers reside, but we're gaining new readers in Australia, New Zealand, Canada, Germany, Sweden etc etc all the time. It would be nice to have more readers in the USA, as well as regular feeds of news and gossip, after all, there's still thousands of Atari users in the USA, and programmers producing stuff like Geneva and Neodesk, which are very popular in the UK.

So, my plea to all USA-based Atari users, is subscribe to the magazine through your local distributor, Rich Tietjens, you don't have to send money abroad, pay in your local currency through Rich, and he sorts out all the hassle for you!

We're hoping to increase the frequency of the magazine, but we need all Atari users to support us. We're not a commercial concern, we're just a bunch of Atari fans who put their own money up to fund the magazine, and we do it for fun and to help keep the Atari scene active.

Anyway, my bit over, but if anyone, anywhere, wants details of the mag, just email us at the address below, and we'll put you in touch with your local distributor or provide you with details on how you can subscribe directly with us.

ATB, Mike Kerslake
Publisher, Atari Computing magazine

>
> Anyone can help?

You will need HD Driver to use a SCSI Quantum Fireball drive on the
Falcon.
Cubase Audio (if that is what you are refering to) only works with
devices
on the SCSI bus for recording.
AHDI and ICD should handle your 850mb IDE ok, just as you say. Much
larger
drives on the SCSI or IDE then you will have problems with both of those
drivers. Some drives they will work with and some not. General cut off
point
is 850mb for them.

Mike

Hi!

I just can't get along with OLGA!

I want use QED and CAB with the OLGA-protocoll.

I know that this should work, CAB is a OLGA-client and
here it stops. The question is who should work as a
server (OL_SERVER) ?

OLGA.APP?, QED.APP? N.Thing? or my girlfriend? and how
can I tell my system, who is who.

I have read the german docs about the OLGA-messages, but
they tell nothing about an installation procedure.

..and all these XAcc-program types:
"ED" stands for editor and my C:\OLGA.INF contains
ED=E\QED\QED.APP

but the textfile OLGAPROT.TXT says nothing about CAB!
DP=DTP, WP=textmanager etc...

Best Regards

>
> Brett Smith

Yes, you can do this. *BUT* you'll need to do some messing
around. If the ST is attached to your Mac's SCSI port, then
the Mac WILL HAVE TO BE SWITCHED OFF. Failure to do this
could conceivable corrupt your hard disk(s), as none of the
ST host adapters (as far as I am aware) support bus-mastering;
hence the two will cause each other problems.

The only other problem you would have to work around is the
fact that neither computer will read the hard disk format of
the other - hard disks aren't like floppies; they have a
partition table as well as the DOS compatible stuff, and the
partition table can be in one of a variety of incompatible
formats on the ST. The Mac is unlikely to understand.

Just a warning:

If the contents of the folders you are seeing are not just corruptions
of existing files, but are gobblegook caused by corruption of the
directory entry for the folder, then the 'files' you are trying to
delete may never have existed in the first place (or at least not where
the system currently thinks they are).

By deleting them you are actually telling the system that what ever part
of the disk it thinks they are occupying is now free to be overwritten.
This might be inconvenient if there is also a legitimate file somewhere
else which occupies that part of the disk.

If it happened to me I would probably spend however many hours it would
take me to investigate the disk to make sure I wasn't doing more
damage... but I can't tell you how to do it.
It takes a fair knowledge of how files are stored and then some
rummagine around the sectors and FATs.

## 312. STeve's Computers...

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: Richard Wegner <richardw@dmapub.dma.org>
Message-ID: <Pine.SV4.3.91.970107174359.27203B-100000@dmapub.dma.org>
Source record: 130522

Does this company exist still and if so, do they support the Atari 16 bit computers (ST/STe)? Also, how about Computer Dungeon, I had good luck with both of those companies in the past and I lost their address and phone numbers. I don't care if they are web sites only, I do have access to the web via my IBM PC Compatable, so I can contact them that way. Also, how about BRE Software...I used to get TONS of shareware programs from them...

NOW: I know this may not be appropiate, but I am also looking for lots of XXX Rated Spectrum Pictures...does anyone know where I can get them?

] magic? Every time I run pagestream, it gobbles up all 14mb of my free TT ram!
]
]
] Matt Faehnle

Hi Matt,

IIRC, call limitmem.ttp with 2 parameters;

1. full filename (incl absolute path if limitmem and the target program are in
different directories)

2. max memory to use in Kb.

eg: <limitmem> d:\pgs\pgs2uk.prg 1024

will limit pagestream 2 to 1Mb

Hope this helps...

Yes indeed it's possible to use aFTP with Cab, in fact it works very

Never saw one.. I have one of the early 520STfm (upgraded to 1 Meg) and it
came with double sided drive (it was one of the first 520STfm to arrive in
Spain) The only differences with the 1040STfm of the same epoch was that
the board had 1 RAM bank unpopulated (some even came with sockets for the
RAM chips), one label with "520STfm" on top, and another one with the
serial number on the bottom.

I have the 520/1040 Computer Field Service Manual of January 87 and there
is no mention to a Hardware Blitter, and the electric diagrams and PCB
layouts had no provision for the chip itself.

Perhaps in the later models of the 1040 STfm (the ones that came with the
surface mounted Glue and MMU, previous to the STe), but I'm not sure now, I
don't remember of any empty socket (or place for a surface mounted blitter)
I'll check it, as I have access to one of this models.

## 317. WTB: Upgradable TT RAM baord

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <5auf5j$hmn@ccshst05.cs.uoguelph.ca>
Source record: 130527

Well, I finally got around to actually checking to see if it was possible to upgrade an older style TT RAM board using the instructions I've been passing around (don't look at me like that: I didn't write them :) ). It turns out the answer is "not easily". It seems that it is necessary to desolder the TTMCU socket in order to cut one of the tracks on the board. I don't mind messing around with my computer, but I hate desoldering. So, I find myself looking for an upgradable TT RAM board to buy or trade for my current not-easily-upgraded 4 meg board. Any sellers?

THeo

## 318. Re: Toad and Emulators, Inc

[Bullcrap deleted...]

Now let me tell you something, Mr. Businessman...

You give your customers no respect and poor service, they don't give yopu any more money and take their business elsewhere. Not a dream world, but pure reality.

You want to make money, fine...but don't expect to make any more than the competition you treats their buyers with the upmost respect.

Dave Troy did respond to the questions about Gemulator registration and Toad's service. He never spout off the baloney you did, but said that they send the registration electronically. Perhaps they should have told the buyer about this, but either way...this is the sort of thing that has the customers coming back for more. At least Dave goes out of his way even though the Atari market is just about dead.

As for Darek, don't know what his story is. Being a brilliant programmer and a good businessman are two different things. I keep reading complants about lack of service from his products and his responsives aren't that pleasant. Now why would I buy from a person like that?

One of these days, people are going to get sick and tired from putting up with the crap that the computer industry force feeds them. They figure since people know very little about computers, the industry can con them for all their worth. So instead of writting essays on how worthless customer service is, remember this saying, "You can catch more flies with honey than vineger".

>this capability. Any help?

Absolutely. If the drivers aren't in the original "package", there are
drivers for the 500 and 550 which work just fine (the 500 for the 540,
and the 550 for the 560 printer). I use an HP 540 all the time with
Pagestream and it works just fine.

Source record: 130535

Hi there...I have a question...first, here is my setup on my Atari 1040STe
---

Atari 1040STe

100 Meg Conner SCSI Hard Drive (with LINK)
1X Nec SCSI CD Rom Drive
Atari SLM804 Lazer Printer
Color and Monochrome Monitors (with Monitor Switcher)
External DS/DD floppy drive (not sure name)
9 Pin Dot Matrix B&W printer

QUESTION: I used to have the Lazer Printer First turned on, then I turned on the hard drive when the GREEN LIGHT came on, then I turned the monitors on, then the external disk drive, CD ROM drive, then lastly the main unit (Atari 1040STe). Now, the green light NEVER goes on my Lazer Printer and I try booting it up (I even put my backup boot disk) and it won't recognize the printer nor the hard drive. WHAT HAPPENED??? Please respond via e-mail. Thanks...

I'm looking for a Marpet forget-Me Cartridge Clock WITH the thru
port as this will be used with softwares requiring a key dongle,
along with the appropriate software drivers. Unfortunately, this
clock is now made without the through port, wich would render it
rather useless unless I resort to costly dongle switchers...
Please e-mail your offers, keeping in mind that I live in Canada
and have very few avenues for making transoceanic purchases. ;-)

## 334. Toad and Emulators, Inc

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: tom.derrick@acpu.com
Message-ID: <852596362@acpu.com>
Source record: 130569

Perhaps it is time for me to weigh in on this subject. I have always found Toad to offer excellent service; I was dismayed to see articles here by people who found their service lacking in some way. Neither Toad nor us are benevolent associations; we go for the best deal, and they go for max profit. Those of you who believe that Toad's increasing emphasis on PC's is an easy business decision are living in a dream world - mom-and-pop PC dealers, at least in my part of the US, look like they are starving. (Of course, the Atari dealers disappeared years ago!) The big chains seem determined to sell only one to a customer; IMO, they are doing a splendid job of making their customers hate them.

Prices are just prices; I have bargain shopped as much as anybody here, and simply pay for what I want, and don't pay for what I don't want. I haven't always gone for the lowest price; sometimes paying a higher price is the better deal. And this really is the crux of the modern business of computer hardware and software buying and selling - without support, the cheapest stuff you can buy can be worthless. *With* support, it can be gold.

Toad, of course, makes /no/ money unless they sell goods or services. Nobody is going to pay them to hang on to their inventory; only selling pays them to stay in business. They obviously cannot afford to buy stock at one price and sell immediately at a lower price. OTOH, I have met several businessmen in my life who (foolishly, IMO) kept their prices high to cover their original costs, long after it became obvious to me that there was very little hope for them to recover those costs. A local ex-Atari dealer, for example, has maintained his original selling price on Atari software instead of dumping it at the prices that it can reasonably be expected to bring (that is, nothing much. Most of it has to be 8 years old or more.) But it is his inventory, and how he chooses to run his business is his affair. If Toad is being similarly foolish... well, it is just foolish - greed doesn't figure in, because asking a price is no guarantee that one will get it.

As far as Gemulator goes, I too have seen intemperate posts from Mr. Mihocka. I have also met him. He is one of a dozen or more people working in or around the edge of this platform that I consider to be authentic geniuses. But I have very little use for emulators; they can be fun to play with, but are rarely useful to me in the grand scheme of things. I have seen Gemulator running on a P6-200; I'd still rather use my TT, although it is slower by some considerable. Benchmarks aren't everything.

On yet another topic: I have some considerable (well, for me!) money invested in my Atari Museum, both hardware and software. Giving it up to buy an admittedly more powerful machine, call it a Pentium 90,

doesn't suit my diehard attitude. It would certainly flush my software library down the toilet, given my distaste for emulators. OTOH, a T60 (or other hotrod clone) would preserve my attitude and my library, even though it /might/ cost more in the long run. It's my life and my money. You can't expect me to jump ship just by throwing around some PC prices and benchmark numbers. To paraphrase Patrick Henry (American patriot and diehard): I know not what course others may take; but as for me, give me TOS or give me death. (Well, I'm not willing to die for it, but I enjoy living with it :)

Message-ID: <25895_SSweet@mettav.demon.co.uk>
Source record: 130571

FROM: SSweet@mettav.demon.co.uk
SUBJ: Magic Apps Folder

>> You can terminate an ACC running as an ACC, just control click on the
>> menu entry.

g> True, which is just one more reason why most people do not use #_APP.
g> All I have in it is a clock utility.

Hm!, ive got a few in there, lets see,

C:\GEMSYS\MAGIC\AUTO\FLP_PAR0.PRG
C:\GEMSYS\MAGIC\AUTO\WBDAEMON.PRX
C:\GEMSYS\MAGIC\AUTO\XMEN_MGR.APP
C:\GEMSYS\MAGIC\AUTO\CLOCK.APP
C:\GEMSYS\MAGIC\AUTO\FREEDOM.APP
C:\GEMSYS\MAGIC\AUTO\START.APX
C:\GEMSYS\MAGIC\AUTO\APPLINE.APX

Ive disabled start as since i up'grd to magic 5 i got a few cases of my hard drive sulking, no porbs with START disabled. Appline i regarded as a toy and hence unplugged that, WBDAEMON caused some nasty Drive corruption, so that hit the fan very Quickly

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

## 337. Re: C Tutorial, Lesson 2

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: Spencer@mettav.demon.co.uk
Message-ID: <25896_Spencer@mettav.demon.co.uk>
Source record: 130572

Out of the ether, the following was mentioned by Derryck...:

SD>> I wonder how many annoyed readers got caught out at that point! ;-
DC> Only those who hadn't read all the article before they started!
DC> (g)
Well it never mentioned at the start that it was to be continued
rather that it was the complete project.

Admittedly most people would have read the whole article before
attempting any upgrade.

## 338. Re: C Tutorial, Lesson 2

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: Spencer@mettav.demon.co.uk
Message-ID: <25897_Spencer@mettav.demon.co.uk>
Source record: 130573

Out of the ether, the following was mentioned by rdupuy5596@aol.com...:

r> This C tutorial is free and designed to get you started. Anyone
r> who wants
r> to learn more advanced subjects after this tutorial ends is free
r> to continue with the many excellent resources available in
r> everybookstore.
I understand that and commend your efforts.

r> I understand what you are trying to say, however, and I'm not
r> offended. Everyone should be aware that I am not under contract and
r> cannot make any
r> guarantees. (Lesson 4 is in the works, however...)
I was only intending to have a slight dig at the tutorial. I was however
mainly using the publication of your tutorial as an excuse to tell this
anecdote.

No slight was intended on yourself or your tutorial. Afterall I recently
attended a proffessionally produced C Programming course which was
considerably dearer than your own. (1600 UKP as opposed 0 UKP for your own)
So do keep it up.

Spencer

## 339. Re: Sweet Geneva!!

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: hsideras@mettav.demon.co.uk
Message-ID: <25887_hsideras@mettav.demon.co.uk>
Source record: 130574

*Hi Petter*, on 05 Jan 97 you wrote: ...respect, brethren

p>
>> You may hold that opinion if you like, but I'd suggest popular
>> experience indicates the opposite.
p>
p> None of the Falcon owners I know have complained of "flaky" machines.
p> There was one case of an unstable machine, but the culprit turned out
p> to be the Wings memory card.

I don't know if it's me trying to rewrite history or a particularly blinkered view of recent events, but since it was revealed that a decision was made by Atari to withdraw from development of the computer line in 1991 - 18 months prior to the release of the Falcon - the half-hearted fixing of basic bugs in TOS 4.01, the standard range of Falcon hardware fixes that were left to owners to do themselves if they happened to find reasons to need them, the reasons everyone held off buying machines until a basic decent spec machine was available and, even now, the way the clamour for hardware enhancements that release the machine from its hamstrung specification, I'm inclined to maintain my view.

Over and above that ISTR System Solutions went through a period where they only recommended memory of a certain make for RAM upgrades to 14Mb due to the number of problems that were experienced (an upgrade certainly within the machine's spec) and I've noticed several people reporting machine failures over the last twelve months unrelated to any particular upgrade.

Perhaps I'm making this all up...

>> ...a good summary of the reasons for the delay in shipping Nemesis is
>> that they were increasing the build quality to such a level that the
>> inconsistencies from one Falcon to the next were finally overcome. I
>> think that tells its own story, don't you...?
p> It tells me the Nemesis team are doing a thorough job with their
p> product, for which all Falcon owners will be greatful.

Absolutely, but that's a different issue. Is the reason I've stated untrue?

p> When you say that you "wouldn't have one at any price" (hey, it sounds
p> like you're talking of PC's)

When I eventually move on it'll be to something like a PC, but I spent Xmas setting up a P100 and I didn't think much of it tbh. I haven't used a Mac in earnest for a few years, but I thought even less of that. I think I'll have to wait a few years before they invent something that genuinely improves on what I have now, rather than offering a few bells and whistles that I can live without.

p> I think you'll miss the chance of using the best computer Atari ever
p> made. It's a joy to use, and with the arrival of Nemesis it seems it'll
p> get even better.
p>
p> Give the bird a try, Harry - I don't think you will be disappointed :-)

Nemesis sounds like a upgrade for a Falcon, but the machine itself offers nothing that I want. For *my* purposes the TT is clearly the best machine Atari made for a whole variety of reasons - I'll continue to look in that direction for my next upgrade.

# Regards, Harry Sideras - UK Association of Atari User Groups #

Go to your SYSTEM folder and check the Tools.cfg file and make sure
it's pointing to your drive. While your at it configure the tools such
as zip to point to your zip program ... Then it should light up like a
Christmas tree ! I had the same problem till I looked at all the CFG
files in this folder .

## 344. Atari in Calgary Alberta?

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: bp507@torfree.net
Message-ID: <E3MG87.BLy.0.sheppard@torfree.net>
Source record: 130579

I will be moving to Calgary, Alberta, Canada soon. Could anyone from there contact me with some information about the Atari users groups (I think that there are two), as well as some information/opinions about local Internet Service Providers that offer dialup text-based shell access, and uncompressed SLIP access. You know, for an Atari. I'm using CoNnect for shell access and STIK/CAB for the web.

Any information would be appreciated. Thanks.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"
```

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
---

1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de"
[CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no"
[CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari"
[CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another

site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are
connected.
- Most files are compressed. Use an appropriate program on your computer
on
which the programs were intended, or in UNIX .......
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities

- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS
---
Part of this is dependent on you having the GNU msdos-utilities available

at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc
a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel
a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject
buttons".

The ST/Falcon were considered the poor mans/women Mac. While Apple developed
and innovated, Atari under Jack Tramiel tries to immitate the Mac OS while not
adding or innovating. Apple lead, Atari followed(failed miserably).

I'd really like to stop NOS POP3 deleting emails that it's read as I also like to use my PC to access the internet and read my email.

Does anyone know how I can stop it including modifying the source code (if available)?

ATB,
Karl.

>Anyone can help?

If it is a Fireball, it requires SCSI bus arbitration. HD Driver and
HUSHI (spelling) are the only drivers I know of that support
arbitration.

TOS cannot boot from arbitrated drives, you must boot from another
drive or floppy.

All the best,
Chris @ Computer Direct

## 350. Re: Holy 16 bits! The Atari _is_ alive

At 22:50:46 on 01 Jan 97, moose@mitt.demon.co.uk wrote this about Holy 16 bits! The Atari _is_ alive

m> Basically, what I'm trying to do here is set up a diskless workstation
m> using the ST, for no better reason than that it strikes me as cool.
m> The Atari certainly appeals to me on a number of levels (the mono
m> monitor is one of the crispestdisplays I've used), and I'd like help
m> turning it into a useful workhorse.

What about HDD_DMN2.ZIP which I discovered at the ParCP download site (ftp.zlin.vutbr.cz) a few days ago. (Why has ftp.zlin.vutbr.cz stopped working?).

HDD_DMN2.ZIP appears to be similar to Ghostlink but over a parallel connection instead of a serial one. I havn't tried it yet, still trying to get ParCP up and running.

You could use MiNT/NFS but you'll have bugger all memory (technical term there) for anything else. The serial speed (even if doubled) is still very slow - I've got 60MB+ to transfer to my ST so i can back it up -That's about 4.25 hours worth. :(

Just read the HDD_DMN2 docs and the support site for this is http://www.upol.cz/~cieluch/atari.html

Good luck!

ATB,
Karl.

For Quantum Fireball drives connected to the TT or Falcon you need a
driver supporting initiator identification/bus arbitration, e. g. CBHD,
HuSHI, HDDRIVER.
With an ST the Fireball can only be used with the LINK96 host adapter by
Norbert Wieczorek.

Source record: 130597

I installed Taylor UUCP on my ST 1040 to
communicate to a PCS Unix machine via null-modem
line.

My ST is running FreeMiNT 1.12.6.

Does anyone know how to configure the terminal
settings in /etc/inittab and /etc/ttys on the
Atari?

I neither do know which device(s) to use nor if
they should be activated by init (via /etc/ttys)
or uucico.

Can anybody help?

Tschuess

Yup I have heard about it. It looks to be rather nice as well as the SCSI
port is uing DMA. Fast and doesn't take any CPU power at all. :-)

> > : The reason I ask this is that I talked to our landlord

> Many people operate it this way !

Well it looks like he will set up a rooter in the basement. I have no idea
how this stuff work, but I guess it wont cause any problems for me, or?

BTW. It isn't decided that he will install it. It does depend on how many
are interrested but hopfully he will do it, if I can use it that is. :-)

It's rather cool I must say. Just plug your computer into a socket in the
wall. No need to block the phone or pay expensive phonecalls. :-))

> It's also only true for now that Ethernet cannot be used with STiK. There
> is work going on to include other interfaces (Ethernet too) into STiK.

Well I doesn't realy care about STiK. MiNT will do. I wold like to get
it running under MagiC thought and then I can't use MiNT-Net or I just
have to sit down and make a decent MiNT installaion. There are many
other nice things with MiNT too. :-)

>Driver. Stick to SCSI and SCSI-2.

AFAIK the Quantum Fireball TM are IDE (or EIDE) drives and should work
fine with the Falcon. I didn't know they made SCSI versions also...

Btw.: What's the difference between SCSI-2 and SCSI-3?

Yeah, i received this too and noticed other CSAST posters in the mail-to
list. I emailed abuse@internet provider from where it was posted and
also CCd it to various other role accounts withing that ISP. I got a
mssage back saying they were looking in to it. I did mention the fact
that all other people who were mailed the message were in the same
newsgroup as me.

I have three things to sell:

- one Steinberg TwentyFour official & complete with english manual.
- one Spectre GCR in a very good condition with system 6.4.
- one Ibanez DM 1000 Digital Delay in perfect condition.

I will not ask too much for these two items I don't use no more.
Feel free to make any proposition.

> cg> It doesn't do PCB layouts....

>..... but v3 does routing, doesn't it?

Yeah, but the autorouter in v3 is so you don't have to draw a path
for every connection in the schematic (similar to the way Electronics
Workbench handles wires). It's also pretty slow on a standard ST
(useful on a falcon or TT though).

>There's only one solution .... we need more Craigs!

No problem - like Zaphods, I now come in six packs....

## 370. Dairy type programme needed...

Newsgroup: comp.sys.atari.st
Date: 1997-01-07 00:00:00 UTC
From: jaubrey@jaubrey.demon.co.uk
Message-ID: <852654948_OASIS_@jaubrey.demon.co.uk>
Source record: 130605

I am looking for a programme that I can use for a daily diary, I need to be able to be able to write in it everyday. Assign dates(birthdays etc..), have search/find function to find a keyword or list of keywords on any days, be able to print daily/monthly accounts as and when needed. If possible it needs to be a ACC as well as a PRG, running in med rez. I know this sounds a lot, but that is ideally what I need! I have already got a programme called Dairy that runs in high rez but this is not flexable enouth. Anyone have any suggestions/ideas where I can get such a programme, shareware or otherwise?

Thanks,

James

I have a question i have ultima ][ for the atari st, though its great having it the conversion was done with new graphics and interface that doesnt hold true to the original and was wondering if it was ever out in the same style as apple/ibm/??

also I have return of the jedi for my amiga and at one atari site it listed it for the st and was wondering if anyone has it? and whats it like

last but not least is their a "Empire Strikes Back" arcade conversion available on any platform hopefully st,

And was Startrek SOS from sega converted to the atari st

thanks

No, sorry the only program to use with Stik is MG-FTP 1.03 :-)

It is a little quirky but it does the job once you get it to work :-)

I have no problem putting my web pages up with it, and downloading any file
I want :-)

You can also get NOS to work under Stik, but it's not so friendly to use
:-(

Yours Roy

>version! This would negate any effort to use a PC parallel port ethernet
>card on any Atari computer, or for that matter any parallel port device
>for the PC other than a printer!

The parallel port is bi-directional, the problem is that it is missing
several of the non-essential handshake lines (things like paper out)
which are used by a lot of parallel port stuff like ethernet cards.
You can bodge a DLINK600 parallel port adaptor into the cartridge
port - MiNTnet comes with a driver for it....

Demon and other UK users should complain to BT - unsolicitedcommercial email
is "theft of services" since the recipient must pay to receive it /AND HAS
NO WAY TO REFUSE IT BEFOREHAND/ (sorry for shouting, but that's the most
important issue in this situation).

And to answer the snipped qustion - yes, CyberSpammo is owned and operated
by the same assh*le who was /the/ single most important reason for the
drafting of the "junk fax" law (Title 47 USC). AOL has instituted a "spma
blocker" policy which CyberSpammo contested in court - and AOL was
vindicated becasue AOL owns their servers and has a right to protect their
assets from unauthorized use.

I suggest you contact support@demon.co.uk and ask if they can and will
institute a similar policy - as long as each user has the ability to turn it
off (not that I have ever heard of anyone on AOL doing so), it's legal in
the US, and certainly ought to be legal in the UK.

OTOH, if anyone wants to send me email discussing less polite means of
dealing with email spammers... Well, start by looking at the source code of
my Web page. Then we can talk.

The best one around is Photoline which is very, very fast. For about half that you can get Positive Image which is almost as good and nearly as fast. Each has its own merits -- PI has some nice built-in masks, Photoline has incredible scaling -- fast and accurate -- it even can interpolate colors so that reduced or enlarged images don't look blocky or jagged.

Talk about two faced. For the better part of the last two years all I
have seen
from you is how well off Apple is and what great hardware they produce.
Now that they are having problems, and clones are finally available, you
jump ship and start ranting about them. That is what I would expect from
some
one who thinks of Christmas in the terms of sales and volume. I'll bet
every
Atari owner on the planet enjoyed a better Holiday Season than you.
Wishy-washy is the polite term. I have a much better one for you
however.
But my New Years resolution was not to pick on Sinclap any more......
ahh the hell with it. Your an asshole.

Mike

>Does anyone know of a program that plays "AU" audio files for Atari
>computers? I want to use it as an exteranl viewer in CAB.

Long Play Sample (LPS.TTP) will do the job. It's up to version 1.24
and can be found at the usual FTP sites. Try ftp.cnam.fr - I think
that's where I got the latest version, the filename is something like
LPS124.ZIP.

> me at jring@scad.edu.

I though I'd send this so as to give you some basic stuff from
someone who knows a bit about PC's, Ataris and Macs. Maybe you can
tell me a bit about the NeXT and Bebox. I thought they were kind of
super-macintoshes that finally worked <g> As you know amiga's then
they'll do for a comparison. Basically ST/STFM/STE were all 68000
based machines in cases very similar to some Amiga's. They had built
in MIDI ports which made and makes them ideal for musicians, and
there's about a ton of professional and not-so-professional software
out there for synthesiser based musical activities. It was also, due
to it's <poor-mans Mac> label, much used in DTP, and the programs for
that were impressivein there day. GEM is pretty much as easy to use
as Windows or MacOS, a sort of cross between the two. OS replacements
and alternatives are not common, however due to its popularity with
student programmers in the eighties there is a Linux port for those
suffering with terminal anoraksia. There are some multi-tasking OS's,
notable Magic and Geneva, though honourable mention must be made of
MultiTos. Due to the Germans having it sold to them as a business
machine (Atari left there subsiduaries to market the machine how they
liked) there's a lot of high quality software from Germany for
business applications. databases, Fax utilities etc. For some bizarre
reason, the Germans also came up with a networking method using the
MIDI ports, and although it is a bit slow, it's OK for groupmail
applications etc, and the underlying idea was also used by games
programmers to make multiplayer games that linked ST's via their MIDI
ports. The ST had a slightly odd SCSI implementation that demands a
converter to be fitted to allow communication with standard SCSI,
although it isn't expensive or hard. I've got a pair of hard-drives
and a CDROM on mine and it's been less trouble to install than a
multimedia kit on a clean PC and a lot cheaper than putting a couple
of hard-disks and a CDROM on a small-cased Mac
The Falcon is a sort of super-ST. By the time they came along,
it was obvious that musicians were the best market Atari had, and
along with the MIDI ports came the ability to do eight-track D2D
recording at CD quality with nothing beyond a dealer mod to the sound
system to take the I/O from mic to line level and a few bits and
bob's. Of course you need a huge SCSI hard-disk for D2D but then you

do on anything you do it on. Given the price you can pick up a Falcon for these days, you can get yourself an eight-track D2D with a 2Gig drive and still have spent less than a grand, if you chuck in Cubase Audio, you're talking a grand and a half for sixteen tracks, go to two grand and you can master your own CD's as well. You won't get near that with a Mac or a PC.
there are no new Atari machines any more, they pulled the plug about eighteen months ago, though some dealers still have new stock. There's still a small but thriving Atari scene, especially in Europe, and there are licensed clones appearing now that offer m,assive improvements over the basic Falcons. As one of these clones uses a very open ended hardware system there are strong rumours that there'll be a 533MHz (yep over half a Gigahertz) Atari clone soon, as the motherboard would allow it.
hope this helps a bit more than some drivelling flame-war involving PSD. He don't like Atari's much but he seems to live on our NG's telling us how wonderful Macs are.

I just got an SLM 804 with a system. I managed to get it to print out
using Calamus but it refuses to print out or 'see' the printer from the
desktop when I select 'print' after double clicking on a .txt file.

I have the slm804.sys file in the root dir of C.
I think the assign.sys is ok.
I have gdos in the auto folder.

Help please!

>
>Hi!
>
>
>I just can't get along with OLGA!
>
>
>I want use QED and CAB with the OLGA-protocoll.
>
>
>I know that this should work, CAB is a OLGA-client and
>here it stops. The question is who should work as a
>server (OL_SERVER) ?
>
>OLGA.APP?, QED.APP? N.Thing? or my girlfriend? and how
>can I tell my system, who is who.

IMHO: QED is the server. To tell it at your system just add on the
mint.cnf
setenv OLGAMANAGER=full path of olga.app

e.g. setenv OLGAMANAGER=h:\olga\olga.app

That's it

I've found that you better start QED before CAB otherwise CAB would
not recognise the first change. However after reloading the page
after the first change on the htm it will work like it's intend to work

On my configuration (TT030, N.AES, Thing 1.09, NVDI 4) it works fine.

Hope this helps
Martin

## 396. A bit of help please

Newsgroup: comp.sys.atari.st
Date: 1997-01-08 00:00:00 UTC
From: cs1cl@stoat.shef.ac.uk
Message-ID: <5b0rql$fvf@bignews.shef.ac.uk>
Source record: 130469

Hi,
I have a bit of a problem. I am solely UN*X but I always seem to get roped in when h/w or s/w is playing up.
This problem is exacerbated by the fact I know nothing about Atari machines other than what can be got from removing the cover...
The latest is a friend with an 1040STf with HD and a b/w monitor. He uses it solely for running Notator. Recently a friend gave him all his old games (Lemmings and other such stuff) but in some cases they refuse to run (like Lemmings) and in others the music plays but no picture. Going into desktop the preferences didn't allow me to change the resolution from "high". Any ideas?

thanks

Chris

Right, but since each program normally creates only 1 cookie, he's going to
have to run an awful lot of REALLY small programs at once to hit the "100
cookie wall" - assuming a 14 meg Falcon, I figure a maximum average size of
143k per program, including system overhead and ignoring video display RAM,
stack space, etc.

>---
>
>Score one for our side!

Sorry, John, but that's just plain bullsh*t.

The address given is OWNED by Cyberpromo, and is not an "account" of a customer. Cyberpromo is NOT an ISP - they sell "bulk email" services, and do not provide connectivity to any real customers. What they actually do is forward mail from their customers (actually, in some cases, they ORIGINATE the mail after the customer says "advertise this product for me") and they also filter incoming mail and pass it back to the customer AFTER removing (a) all "Remove" requests (so your request does nothing except validate your email address - this was heavily documented in Summer 1996 by the sysadmins at several of the major ISPs in the USA) and (b) all flames.

Thus, the Cyberpromo customer never sees any flames anyhow.

My personal opinion is that Cyberpromo originated that bit of flame-bait for the specific purposes of validating email addresses (if you complained, you

obviously got their spam), and pretending to be a good guy by "terminating" a non-existant account.

In point of fact, you should have kept the email, printed a full copy of it including all headers, and toddled down to the office of your local US Attorney to file a damages suit under Title 47 USC para 227. That law defines a "facsimile machine" in a manner that is identical to any personal computer with a faxmodem and a printer - and makes sending unsolicited commercial messages to sucha a machine illegal. If Cyberpromo fails to show up (and they aren't going to bother to fly to Hawaii, you can count on that), you will be awarded a summary judgement against them. Be sure to claim damages of $500 PER MESSAGE plus court costs, plus collection expenses - then when they don't pay up, turn the account over to a collection agency.

Eventually, they'll be put out of business.

Disclaimer: I Am Not A Lawyer (I'm a human being with feelings).

>
>Does anyone know how I can stop it including modifying the source code (if
>available)?

I don't think the source is available for NOS POP3, but a quick and dirty untested hack could be: with a binary editor edit NOS.TTP and overwrite the string "DELE %d[10][0]" (there is only one, at +250118 of the executable file) by "NOOP[10][0]". The "[10][0]" are of course only the two bytes LF and NULL.

Make this only on a copy of NOS, and say us if it works, I didn't test this. In fact I'm not sure if all POP3 servers know the NOOP command (in this case replace it with another one with a "+OK" response), and some servers could even automatically delete all RETRieved messages when you QUIT the session (bad behaviour, even if possible according to the RFC, change server).

Bye! Bruno.

In Spain there are thousands of 1040s in visit-card machines in stations
and commercial areas.

One day I saw one of those machines under repair with the cover open, and
inside was a 140STFM with a cartridge inserted, some sort of inkjet printer
with a cutting mechanism, the insides of an Atari mono monitor and a flat
keyboard attached (maybe to the serial port).

If all you have is high resolution, then you must be using a monochrome monitor. Most games require a color monitor which runs in low and medium resolution. The ST autodetects which type of monitor it is attached to.

You can buy an inexpensive switch box that will allow you to switch between the two different types of monitors without continually plugging them in and out. (If you can find a decent deal on a color monitor, that is.)

## 411. DSP/CPU mod on Falcon?

Newsgroup: comp.sys.atari.st
Date: 1997-01-08 00:00:00 UTC
From: guitarmn@earth.execpc.com
Message-ID: <5b15r2$77j@newsops.execpc.com>
Source record: 130484

I'm running Logic Audio Falcon. The screen locks w/extensive
tracks/samples. Is there a mod to keep the CPU and DSP synched properly?
If so, how do I do it?
Thanks in advance. Please e-mail to address below.

Has anyone with a TT use a patch program called TT GAME which makes the TT play ST games?

I downloaded it from a BBS sometime ago to look at it, just to see if I can get a game I'm writting to run on a TT. I still have STOSfix 1.1 which supports TOS 3.x on the TT so I'm wondering...

If the thing works, then might be good playing ST games on DirecT/40 or Medusa...especially if it has a PC card for running Windoze 95 and DOS games as well :)

I've had a look around at the Csound pages and using FTP search engines as
well, but so far I haven't found any Atari version of it. Is it available
at all?
Also, will it work on a standard STe, or just on the Falcon?

Hi Uwe,

Will Link96 allow you to boot from an arbitrated drive? I thought that this was not possible with TOS, at least awhile back you had mentioned that it was not possible to boot from an arbitrated drive because TOS would not allow it and that a driver could not fix this problem. Does link96 with HD Driver solve this issue once and for all?

Could you clarify this?

Do you have an e-mail address for the dev of Link96?

All the best,
Chris @ Computer Direct

## 418. NVDI help needed

Newsgroup: comp.sys.atari.st
Date: 1997-01-08 00:00:00 UTC
From: Michael Grove <**mgrove@owens.ridgecrest.ca.us**/spam>
Message-ID: <5avl0t$k3h@ash.ridgecrest.ca.us>
Source record: 130491

I did a stupid thing when I upgraded NVDI for
TOS and MagiC Mac from V3 to V4. I didn't note
at home the key or serial number on the master disk.
The new disk I got back were identical with different keys.
The recipt from the vendor had the old serial number,
but I can't match it to the disk pair. And of course
I have mixed up the disk with the package they came
with, however, neither manual states specifically
which one is for MagiC and which is for TOS.
How do I tell which one is for MagiC Mac and
which is for TOS?
I installed one set on my Falcon and NVDI shows
as being V4.11r3. The machine acts buggy now. One
problem I noticed right off was a "stuck key" noise
when I change video modes. I installed the same
version on MagiC Mac, but have problems with the
video modes there.

Thanks to anyone getting me out of this mess I made:)

Mike

>change the resolution from "high". Any ideas?

Most games require color - and with the SM124 high-rez monitor plugged in,
the ST knows it can't do color. Unplug the monitor and connect a TV set's
antenna input (75 ohm) to the little RCA jack next to the monitor jack on
the back of the ST. This will only work if the ST has a modulator built-in,
of course. If he has no modulator, he won't have an RCA jack, either. In
that case, he needs to get a suitable color monitor (ideally, a used SC1224,
as they can be had for as little as $25 from Atari users, and sometimes $5
from Goodwill) or an external modulator (in which case, you;re on your own).

The Atari color video signal is RGB analog at NTSC sync rates; a NEC 3d
multisync (or any other VGA multisunc that can handle 15.75 kHz sweep rates)
will do it. The NEC also permits using ST high rez on the same monitor.
Details are at my ftp site (See .sig) as "multsync.faq"

Amiga monitors can also be made to work, but are a bit pricey.

The final option (perhaps less expensive than another monitor) is to cobble
up a cable that brings composite video out of the monitor jack and plugs
into the video input on a TV or video monitor. Again, a modulator is
needed, else there is no composite video output. See "pinouts.zip" on my
ftp site for the monitor jack pinout.

>
>
>Somebody mentioned Stewart 104E being available on Umich. As I can not
>reach this site: any ideas which other FTP site I can get the file?

Hit my Web page (see .sig below), click on "Archives" and select the
Washington University mirror site. You have a choice of http or ftp access.

An ftp search on "stewart" turned up the following links:

ftp://ftp.gui.uva.es/.1/atari/Desktops/stewart.lzh
ftp://ftp.utbm.fr/pub/.pub2/atari/Desktops/stewart.lzh
ftp://ftp.utbm.fr/pub/.pub2/atari/Desktops/stewart.lzh
ftp://ftp.cs.tu-berlin.de/pub/atari/Utils/Misc/stewart1.lzh
ftp://ftp.cs.tu-berlin.de/pub/atari/Utils/Misc/stewart1.upl

The last one is just a short text file, 137 bytes; all of the others date
back to either October or February 1996, so they probably aren't what you're
looking for.

No slip up! CAB2 contains full frame support as well as support for a
lot more HTML tags. Hence the version number jump.
It just isn't available yet, that's all.
The current version of CAB IS 1.5.

This is generally correct. There is only one exception to this rule: An
ST with LINK96 host adapter (by Norbert Wieczorek) will boot from such a
drive. In this special case the host adapter supplies a fixed SCSI ID of
7 for the ST so that the Quantum Fireball will work.
With any other host adapter it won't work. At least the LINK96 is the
only adapter I know of that supports initiator identification on an ST.

Cross-posted to: comp.sys.atari.st,comp.emulators.misc

How did you run Gemulator 96 with a TOS image? Did you use the Tosdump.prg that came with STonX to dump the ROM? And do you think there would be a problem with TOS 1.2 (Mega TOS)?

I would like to try the Gemulator demo have been unable to because the MagiC PC demo is in German. It had some errors which I couldn't figure out so I gave up on it.

As far as using TOS ROM's, I don't see a problem because all I have to do is cross the room boot the Mega 2 and dump the rom. Besides, what can Atari say after they dumped the ST years ago?

New version 2.27 of Family Tree, a genealogical database for Atari computers, for which I am the French translator. Family Tree is freeware.

Main features:
- compatible with ST, STE, TT, Falcon, MultiTos, MagiC, every resolution >= 640*200,
- all dialogues are in non modal windows,
- context sensitive on line help, in ST-Guide format,
- full manual in ST-Guide and Papyrus format,
- compatible with GDOS, SpeedoGDOS,
- clipboard compatible,
- import and export in GEDCOM format,
- comprehensive data management (for example 40 children per marriage, no limitations on the number of marriages, uncertain dates can be qualified, etc...).

New in version 2.27:
- import/export in CSV format (delimited ASCII). This allows to communicate with spreadsheets, databases, word processors, etc.

Available from ftp.cnam.fr
/pub/Atari/Applications/family_tree-v2.27-english.lzh
Papyrus manual is in
/pub/Atari/Applications/family_tree-english-papyrus-format-manual.zip

I don't know what you exactly means by profesional but anyway try
Photoline v2.25
You can find more information about it at:

http://www.magmacom.com/~nima/html/grafx/photolin.htm

On the same page you can download a demoversion.

You can also try Positive Image. This package takes avantage of the
DSP and can do quit a lot but it doesn't support gif. I don't know how
fast it is on a Falcon but on a TT it's deadly slow. You can find a
demoversion on the most ftp-sites.

So "remove" messages makes them spam harder and flames aren't even
sent(return address doesn't exist), these pigs are getting worse. At
least now I'm not including my e-mail address when I send my postings
out, the Demon UK gateway could care less if I type "fghjsfgukj"
in place of the address I can by contacted with.

Hey, you want to talk privately with me...use my e-mail now in my
sig. But if anyone even thinks of spamming me, you better have $500
for each letter you send cuz it'll cost you.

BTW, wasn't CyberPromotions an operation in Philidelphia? I remeber
seeing them on "The Site" show and they were boo-hooing about AOL
canceling their account for spamming. Now you know why I think this
should be regulated like phone calls and faxes. If the spammers are
balling about their "rights", what about OUR rights?

## 434. Help? -- Atari disks

Newsgroup: comp.sys.atari.st
Date: 1997-01-08 00:00:00 UTC
From: bn737@freenet.carleton.ca
Message-ID: <bn737-ya02408000R0801972023070001@news.roc.infi.net>
Source record: 130507

Hi, folks. Can anyone give me some advice? I used to have an Atari ST -- not sure what model, but it was pretty early, bought it in 1987. Had a floppy drive, no hard drive... Well, the machine itself is gone, thanks to my mother's enthusiastic spring cleaning, and I have some terribly important files -- the *only* copy of something I wrote in college, a work dear to my heart that took quite a few years to complete -- in "1st Word" format on floppies.

I've tried every sensible thing I can think of, and waved a few dead chickens, but I cannot retrieve the files. My Mac's Finder says they're PC disks, but though it recognizes that *something* is taking up room on them, it lists no files. (I tried them on a PC, also, and it was unable to read the disks at all.) On the Mac, I also tried opening them in ResEdit -- it sees files, but calls them all "BAD" and can't open them. On someone's advice I tried opening the files from within Microsoft Word, viewing "All Files", but it also lists all files on the disks as "BAD" and can't open them.

I downloaded an Atari ST emulator called "MagiCMac" in hopes that it might be able to understand the files -- however, the emulator itself is in German, and 3 years of high school German did not seem to equip me for poking around an unfamiliar program. <g> However, the dialog box that pops up when I try to access one of the disks doesn't look too promising.

In essence -- help! I desperately want these files, but don't know what else to try. Do I need to find someone who owns an ST who can convert them to something I can use? Or is there anything else I might try? I am a writer cruelly separated from one of her beloved works, and I feel like a bereft mom. (But not, I hope, the sort of mom who throws away a perfectly good computer just because someone had it in a closet!) <g>

Any advice will be *hugely* appreciated. If possible, please email me at bn737@freenet.carleton.ca.

: I just got an SLM 804 with a system. I managed to get it to print out
: using Calamus but it refuses to print out or 'see' the printer from the
: desktop when I select 'print' after double clicking on a .txt file.

: I have the slm804.sys file in the root dir of C.
: I think the assign.sys is ok.
: I have gdos in the auto folder.

If don't use Ease (and perhaps other desktops with similar equipment) you
cannot print just like that from the desktop. You then need an additional
printer driver like Diablo or Laserbrain.

Ease supports printing window contents from the desktop with vector-gdos
(This is no advertising, I simply have no experience with other
alternative desktops).

Bye,

Kerstin

This particular vendor has never returned any of the disk I have sent
them
for upgrading. I did however find a couple of text files that I saved
with
the original key and serial numbers and then could match the disk that
way.
The MagiC Mac NVDI disk would not load with the new key that was
provided and
I had to use the serial and key from my TOS V4.10 disk to get it to load
on the
Mac. Still, even with a "clean" install, I cannot get MagiC to boot with
the V4.11r3 NVDI for Mac. Cannot load a driver for this
resolution.......:(.
Went back to 3.31 for now.
As the other dealer has yet to respond to my email, maybe Computer
Direct could
upgrade both my 4.10 for TOS and defective 4.11r3 for me? :) <grin>

Mike

Yeaow!! That's a pretty old version of the list you've got there!
To get the latest one you can either go to my web page, or FTP it from my
FTP site. I try to post an update once at the end of every month to this
and the tech newsgroup.
I've also made a WWW page of the list so you can access all the sites
directly using WWW!

Check out the links in my signature below.

Hi all

Glad I got my usenet bit working recently again, as I was just about to upgrade MagiC 2 to MagiC 5. And mainly to allow me to m/t on my Falcon (improved by Paul Rossiter 4.04 version!).

It's starting to seem to me that perhaps Geneva/Neodesk is the better option for the Falcon, but I'm very open to persuasion!

So, I'll think I'll wait and see how things develop a bit more, before upgrading MagiC.

Maybe, just maybe, I haven't wasted 40 quid yet!

ATB, Mike

## 447. $$$$$$$$$$$$$$$$$$

Newsgroup: comp.sys.atari.st
Date: 1997-01-08 00:00:00 UTC
From: sjmunchak@aol.com
Message-ID: <19970108021400.VAA19815@ladder01.news.aol.com>
Source record: 130545

Take five minutes to read this and it WILL change your life.

I've been a fool so far. Yes, I admit it I've been a fool. I've
been doing this on local BBS's for the last 2 years. I've been
getting about 40 to $50,000 a year if that. I tried it the net
3 weeks ago and I wouldn't believe it! Not just a little each week
(barely enough to keep my head above the debt), but tons, I mean
big bucks! In the first week I got three hundred dollars, then a
week later, a couple of thousand, and by the end of the third week,
I had recieved nearly $32,000.00.

It's REALLY SIMPLE to do too!!!

Here's all there is to do:

STEP 1.

Invest your $5 by writing your name and address on five seperate
pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING
LIST."
(In this way, you're not just sending a dollar to someone; you're
payingfor a legitimate service.) Fold a $1 bill inside each paper,
and mail them by standard U. S. Mail to the following five addresses:

1-Sam Coice
25550 Buckthorn Ridge Rd
Pioneer Ca 95666

2-Peg Vickmore
14905 Highway 88
Jackson, Ca 95642

3-Brian Hyson
4278 Sayoko Cr
San Jose, Ca, 95136-2335 USA

4-Daniel Hanlon Jr.
6001 Fox Run
Fairfax, Va 22030

5-Joe Munchak
13535 Union Village Cir
Clifton, Va 20124

STEP 2.

Now remove the top name from the list, and move the
other names up. This way, #5 becomes #4 and so on.

Put your name in as the fifth one on the list.

STEP 3.

Post the article to "at least" 250 newsgroups. Rembering that the more that you post on, the more people see it, and the more you will get. There are at least 30,000 newsgroups at any given moment in time so don't be stingy.

STEP 4.

You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back about 5 responses. Yes, thats right,only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

>Is there a program that I can use to help me delete these ugly files?

I should have thought of this first: try grabbing the "rm" program from someone with a MiNT setup (email me if you want - I have it here). Re-name it "rm.ttp", copy it into the directory that you want to delete the file from, then open it. Enter "*" for the parameter. Should clear out all files. If you want to remove a directory, use the "-r" option.

WARNING - DO NOT DO THIS FROM A DIRECTORY WHOSE CONTESTS YOU WANT TO KEEP.
DO NOT DO THIS FROM THE ROOT DIRECTORY.

Mike White (michael@fastlane.net)

Source record: 130549

Hi all!

I'm using STiK 1.12, which works fine with NEWSie, but with CAB, it's at best sporadic. I've tried CAB OVL 1.18 and 1.21. 1.18 works for a short time (a few pages), then I'll start seeing "Receiving 0 bytes" forever. 1.21 is does that from the start.

I can run NEWSie for hours (literally). I don't have any trouble with the CAB OVL for MiNT (which causes my Mega STe to be a wee bit slow).

Any suggestions?

Mike White (michael@fastlane.net)

>them.

Al, as I already explained in a different message thread, if someone doesn't receive the product they ordered from a reseller, they need to contact that reseller about it, or return the product and do business with a different reseller. In this particular case, someone contacted me claiming to have purchased a Gemulator but offered no proof of purchase. No registraton card, no sales receipt, nothing. I cannot, and will not, provide any support to someone who can't show proof of ownership. I am not aware of any software companies that don't ask for proof of ownership. Call up Microsoft or Corel or Lotus or whoever and ask them to send you a replacement for some product you don't own. Don't provide any proof of purchase, just bitch and scream and demand they send you a free disk just because you claim to have purchased the product. If they do, lucky you but my guess is they'll tell you to take a hike.

I don't believe that our policy of asking for proof of owndership is in any way unfair to the legitimate customer.

First of all, I would like to point out that Toad, along with any other Atari dealer that sells Gemulator is given registration cards to include with the Gemulators that they sell. For some reason, Toad was not including the registration cards with Gemulators, and we also have reports that they were not including the full printed documentation.

While this is unfortunate, I cannot speak for Toad or any other reseller of Gemulator. We ship product to dealers. Dealers resell the product. As I stated in the earlier email, if the dealer sends you an incomplete package, you need to contact the dealer to get the rest of the package.

In the case of the registration cards, your sales receipt is just as good as a registration card. Simply mail a copy of your sales receipt to Emulators Inc. and you will be fully registered.

The Mint/MintNet combination will allow PPP combinations (and CSLIP and SLIP). You can either install from scratch, or use one of the prepackaged kits, such as KGMD or the TAF distribution, both of which require a MinixFS partition. If you don't want a MinixFS partition, there is a PPP kit available (on cnam, I believe) which does not require one.

NO!!!!!!!!
Do not use limitmem any longer. This program is no longer needed.
Just do "install application". limitmem changes the program file which
can cause problems, e.g. with anti virus utilities.

You might want to try my ISP which has a POP in Calgary. They are a good
deal here in Ohio, don't know how busy they are in Calgary though I
haven't heard any bitching from that direction 8^) their number is
403-265-4590 and the name is concentric.net, they have a nice UNIX shell
with all the goodies plus a true uncompressed SLIP that works with all the
STIK stuff.

## 475. HELP!! Link Virus?

Newsgroup: comp.sys.atari.st
Date: 1997-01-09 00:00:00 UTC
From: "K. Brooks" <newhoriz@huey.cadvision.com>
Message-ID: <32D590E1.46F9@huey.cadvision.com>
Source record: 130373

HELP!!!!! In the last week I have encountered a strange anomaly coming up on screen in the upper left corner of the screen at bootup and sometimes during operations at the desktop level. I am using Magic 4/Ease/NVDI on a TT with Nova graphics card and a 17" Mag monitor. In the last 3-4 weeks Diamond Mirror has been reporting that partion E (1 of 5 on a 2.1 Gig Conner inside the TT) has errors and I should run Diamond Edge IMMEDIATELY. I go into Edge and check the E partition and there are no problems to report. Now in the last week these letters have been appearing on screen:

BO[BFOJ

I cannot get a directory window for floppy A and get 11 bombs showing up on my PTC1426 sitting off to one side. Today I rebooted over and over and many times got 4 to 11 bombs on boot. Sometimes a message from MagiC that there was a fatal error in GEMDOS. Sometimes I could get to the desktop, sometimes not. Oftentimes the computer would freeze just as Ease was coming up with the typical green Atari background but before any icons appeared. When I tried to run Edge it crashed with 11 bombs. When I tried to open a window for C Drive, only the outline of the window appeared and then crash again with 11 bombs. As I understand it, 11 bombs means a "line 1111 instruction - line 'f' error" which means nothing to me at this stage. Also, 4 bombs at boot means there has been an illegal instruction with 2 programs possibly trying to access the same memory space.

I'm getting no where but Chris Krowchuk at Computer Direct thinks it may be a link virus that will progressively destroy the executables on my drive. I'm going to get a bunch of Zip disks tomorrow and do a backup of my drive before reformatting and checking all the files with UVK (as soon as I can get my hands on it!).

Does anyone else have any ideas what the heck is going on? Is this a virus or is Diamond Mirror detecting something wrong that Edge cannot seem to find?

All suggestions gratefully welcome!!

Keith Brooks

>>does somebody know a professional photo-processing software
>>that supports DSP and a lot of usual grfx-formats
>>(like jpg, gif, tiff, ...)

Well, MGIFv5 (latest beta is v5.10) is not professional in the meaning
that it's sold commercially. It's jolly good, though, IMHO. ;-)

No TIFF support, but extremely fast GIF loading, JPEG loading via JPEGD
(with the latest beta). Targa, PPM and (X)IMG are also supported.

Images can be stored internally in greyscales, mapped colour or 24 bit
depending on what you want to do. For graphics cards, only 8 bit VDI based
output is supported, but Falcon TC can be used.

Images are never displyed in windows in the current version, only full
screen (which can of course be scrolled). MGIF displays very fast, though.

>>it should be fast, doing saturation, sizing, converting, ...

MGIF is very fast for most things. In fact, the demos I've tried of the
commercial programs have been slower, sometimes a lot.

A 3x3 convolution on a 640x480x8bit image takes about 1s with MGIF on
a Falcon and a 5x5 one less than 2s, IIRC.
This is of course using the DSP, which can also be used for fast 3x3
medians. I don't think any of the commercial programs come close.

>The best one around is Photoline which is very, very fast. For

It would be interesting to compare it to MGIF. (Hmm, perhaps I already did.)
Is there a demo around perhaps?

>about half that you can get Positive Image which is almost as
>good and nearly as fast. Each has its own merits -- PI has some
>nice built-in masks, Photoline has incredible scaling -- fast and
>accurate -- it even can interpolate colors so that reduced or
>enlarged images don't look blocky or jagged.

MGIF has very fast filtered scaling and rotation and lots of other image
processing stuff as well, some of which you won't find in the commercial
programs.
There's no way to do manual editing with pencils or the like, though.

Since MGIF is FreeWare (you're encouraged to send me something if you like
it, but you'd be the first) it won't cost you anything to try it.

It could also be good to have something to compare the commercial offerings to. ;-)

Both the latest full release (v5.01) and the latest betas (v5.10beta) are available at my WWW site (see .sig). Please, note that you _need_ the full archive even if you fetch the beta, since a lot of files (among them the documentation (ST-Guide)) are not included in the latter.
The beta is quite stable and you really should use that. I've just not got around to finishing it up and updating the documentation.

Please, feel free to ask any questions you like about the program.

I'm very interested in Nemesis/Afterburner... but most Falcon accelerators seem to experience prolonged (or infinite) delays and I fear that the more machines come in for upgrade, the more variation in machines becomes apparent. What seems robust with the first 5-10 machines fails on several of the next 10.. and so on.

I really hope you are right and Nemesis works a treat - I'm in 'wait and see' mode.

robscha@data.rhein-main.de previously gibbered to All ...

Hiya Robert ...

>> MPlayer now creates animated GIF's from version 2.30 on ... I know

r> How much? :-)

Details are as follows:

Cost: 15DM, Can$15, US$10, 60F or 7Ukp

You can send it direct to the Author (Guillaume Tello in France), or there are UK and Canadian registration sites.

r> How i can get it??

It's available on many BBS's or the following Web sites:

http://www.allatsea.demon.co.uk
http://www.tripnet.se/~mille
http://www.magmacom.com/~nima

Please note the top address is mine and some people have reported problems getting the file. It has been checked and is there but I have reported the problem to my ISP to see what's up. I've managed to download it without a problem ...

r> Status? PayWare, ShareWare?

It's shareware. The unregistered version is mono only ... that's the only restriction.

In the next two weeks Guillaume hopes to release a version that will work on ST(e)s and Mega ST(e)s .. until then it is TT/Falcon only.

## 484. Frontier questions

Newsgroup: comp.sys.atari.st
Date: 1997-01-09 00:00:00 UTC
From: msh@ast.lmco.com
Message-ID: <5b3puu$r06@tel.ast.lmco.com>
Source record: 130382

I just got Frontier: Elite II, and I've really been enjoying it. I
do have a few questions and problems, however:

1. I've heard just about universally that it is hard drive installable.
I copied the files from both disks onto my hard drive and attempted
to run FRONTIER.PRG in ST-Low, but it just locked the machine. What
is the secret? (I think there should have been a system-specific
card detailing how to load, install on HD, etc., but the person I
bought it from apparently didn't have it.)
2. Is it normal for the autopilot, upon guiding the ship into a space
station's docking bay, to smear you across the side of the station
instead? Five times (i.e., new games) in a row??!! (Fortunately,
I learned to watch docking VERY carefully and take over manually if
it looks like it's going to crash, but that's a bit annoying; that's
what the autopilot's for, after all.) It shouldn't be a matter of
requiring maintenance, less than 2 months into the game.
3. This may also be from the missing card: how do you change your
name from Jamison (which affects the savegame filename)?

Just this once, could I please request email replies in addition to
posts? I'm switching jobs, and I'm not sure about the status of
reading news before I get stabilized sometime next week. Please reply
to msh@qadas.com . Thank you very much for any help.

Source record: 130383

dear god,

i recently purchased an atari hard drive (yeah, they still exist), and decided to instal NeoDesk3 because i thought it looked nice and neato... and i got it for 2 bucks from Toad. so, after running the self-installation program, and choosing the option to boot straight into Neo, i ran into a little problem. everytime i boot my computer, the correct HD driver version comes up, number of foders, cookies, etc... and then i get a 3 bomb error and my computer (1040ST 4 meg, TOS 1.4) re-boots. my hard drive and floppy drive are fine, memory test always checks out, and my other programs work fine. anyone know what the deal might be, and/or how to fix it??? thanks bunches...

## 489. Mac read ST floppies?

Newsgroup: comp.sys.atari.st
Date: 1997-01-09 00:00:00 UTC
From: Rob.Schafrick@taf.to.org
Message-ID: <3f4_9701100900@to.org>
Source record: 130387

I seem to remember that Logic Mac might be able to convert
Notator/Creator files. Once you get it into Logic Mac,
you can save it as a MIDI file, and then load it into
Vision.

You should probably consult a friend or store familiar with Logic
Mac.

Hope this helps...

## 490. Notator for TT 030?

Newsgroup: comp.sys.atari.st
Date: 1997-01-09 00:00:00 UTC
From: Rob.Schafrick@taf.to.org
Message-ID: <3f5_9701100900@to.org>
Source record: 130388

Notator may run on the TT in ST-hi or TT-med if you use v3.2,
the version that supports Log3. I tried running it in TT hi
without success. The program crashes.

I would suggest switching to Logic. Then you are able to run
Notator and Logic using the same key, and retain upwards file
compatibility.

## 495. Need help with "Connect"

Newsgroup: comp.sys.atari.st
Date: 1997-01-09 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d43dda2548761@sn.no>
Source record: 130431

Due to changes in phone pricing in this country I need to change my
"connect.num" file.
But the pricing is a little more complicated than it used to be, so I was
hoping that someone here could help me out.
Here's the pricing details that I need to enter in the file:

Time of day pricing
---
weekdays 0800-1659 (0.40) + 0.23/sec

weekdays 1700-0759 (0.40) + 0.14/sec
all weekend

From the above you can see that any call costs 0.40, and on top of that
each second is charged, so how do I incorporate this into Connect?

Another question regarding Connect: I've had problems with the
international character set for a long time. Not that it doesn't work, but
when it's accessed, from say a web page in Lynx where Norwegian, German,
Swedish, French etc. characters are being used the "Graphic" character set
is enabled automatically for some reason resulting in 'garbage' where
accented characters or whatever should be used.

Has anyone else experienced this? I have no idea what I can do to remedy
this problem- my only solution so far is to access the menu in Connect;
<setup>/<char set>, set the second character set from the top to
"multinational" (there are 4 rows, only the two first matter as far as I
know- row1 is set to "US ASCII", and row2 is set to "Multinational"), then
do a "re-read" in Lynx to refresh the screen with the proper character set.
Very annoying!

I've set Connect to "Vt-xxx (ISO)" and "8bit ISO", so I suppose everything should
be correct. And the terminal setting is VT-100.

The following messages have been posted in NeST (Network ST) messaging areas.
They're pretty definitive ISTM. Go get 'em...

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
From: Dave Murphy
Subj: Nemesis upgrades
---------[N.FALCON.MISC]---------------------------------------------
I just thought you'd all like to know that Nemesis boards are currently
available. We're only offering a fitting service at present as the manuals
are not yet back from the printers.

For details of the fitting service contact :-

Titan Designs Tel : 0121 - 693 - 6669
6 Witherford Way
Selly Oak Fax : 0121 - 414 - 1630
Birmingham
B29 4AX Email: 100345.2350@compuserve.com

There will be a fitting service available shortly in Scotland too - more
details when it's properly organized.

For those of you who'd like to know a little more before deciding which
option to take (D.I.Y. or professional fitting) there will be a review by
Simon Coward in the next issue of Atari Computing.

All things being equal the manuals should be available next month, allowing
the strong of nerve to attempt installation themselves :)

From: Doug Little
Subj: Nemesis
---------[N.SUP.ATARIPHILE]----------
I'll try to explain this otherwise confusing situation:

We have not recieved the final versions of the Nemesis manual from our
printers, and since these manuals are required for DIY installation, it would
be unfair of us to expect users to be able to work it out themselves, or to
work from unofficial diagrams put together by ourselves. For this reason, we
are holding back distribution until the manuals are ready.

However, because the fitting instructions are NOT required for Nemesis sales
covered by the upgrade-service, we are able to perform the upgrades _before_
the manuals arrive. We are trying to account for some of the 'buildup'
resulting from previous delays. This seemed to be the only fair and practical
way to deal with the situation.

We do realise that some customers who have already placed orders, and are
waiting for the product _are_ capable of fitting Nemesis without the final
manual, but we are not prepared to 'experiment' with the situation and so we
must unfortunately wait for the manuals to arrive. We expect this will not
take very long now. We also apologise to the people who have ordered Nemesis
and are still waiting for the product for this additional delay caused by the
late arrival of the manuals.

Doug.

Problem is that, most games were meant to run in color! He will either
have to figure out how to connect it to a TV via the scart connector or
get an Atari SC1224 color monitor.

>.

Frank,

As a member of the Executive of CACE (Calgary Atari Computer
Enthusiasts) let me welcome you to Calgary and invite you to our Club
meetings. We meet the 1st and 3rd Mondays of each month, at 7:30 pm
at Crescent Heights Community Hall. I can provide directions via
phone or email when you arrive. I think you will enjoy our little
group. As a native of North York and resident of Calgary for the last
15 years I can also say I think you will enjoy living in Calgary. It's
a great city.

As for a private Internet Service provider offering text-based shell
access, I have not been able to find one. We do, however, have a
Freenet that offers this service. A basic account is $20/year.
Member's access is $50/year. My ISP can offer you uncompressed SLIP,
but to be honest I was never able to get CAB/STiK to work with it.
Instead I am using MiNTNET/CAB to achieve a PPP connection. This does
not require a dedicated partition and is rather easy to set up. If
you like I can help you with this when you arrive. I have also gotten
Antmail, Newsie and AFTP10B3 working with this setup.

Email me at carmant@internetfirst.com and we can go into more detail
on all this.

Found it!

Apart from Peter's music page, which leads you to loads of docs but no binaries, I found the ftp site for it.

ftp://ftp.maths.bath.ac.uk/pub/dream/ATARI/

No wonder you didn't find any csound directories! Although, the actual file is named csound.ttp. Remember to go back up a directory to get some docs and things, or visit one of the various web pages at leeds or datrtmouth, especially to get the FAQ. And there was also the item that spurred off this thread, the well-done Keyboard article/tutorial on Csound.

From what I understand, the Csound programming language compiles a series of defining and manipulative commands to produce a sound file, either .wav (probably on the PC version) or .aiff, which seems more likely for the Atari. So once you create your sound progs, you can create a score file which calculates everything and outputs a final sound file.

You can use it to either create new samples for your synths and playback devices or make a whole song from scratch, after creating your sounds. Note that most of my info is gleaned from the Keyboard mag article and perusing the FAQ, so I don't know exactly how much functionality the Atari port has. If I get a spare year or two, I would love to explore it fully, as it seems to be an immensely powerful synthesis compiler.

So to come to the point, I don't think it needs to do anything in real time. You can create your files and listen to them by whatever means.

Have fun and all that.

From: Uwe Seimet <us@bruker.de>
Message-ID: <32D4A95A.1776@bruker.de>
Source record: 130439

Chris Krowchuk wrote:

> Will Link96 allow you to boot from an arbitrated drive? I thought that

Yes, it will. It's necessary to make a difference here between bus arbitration and initiator identification. What some drives (e. g. Quantum Fireball) need is initiator identification. This means the computer must have a unique SCSI ID. On the TT and Falcon this ID is provided by some hard disk drivers (CBHD, HuSHI, HDDRIVER, concerning ICD I don't know). On the ST (or for the TTs ACSI bus) initiator identification can't be supplied by software. You need special hardware for this and the only host adapter that works in this case is the LINK96.
Bus arbitration is even more advanced than initiator identification and is supported at least by CBHD, HuSHI, HDDRIVER. You need bus arbitration if you want to share a SCSI drive (or another SCSI peripheral) with several computers. Contrary to initiator identification bus arbitration is not possible with an ST, i. e. the LINK96 can only support initiator identification, not bus arbitration. But fortunately initiator identification is what most users need and what satisfies Quantum Fireball SCSI drives and some others. You can expect that more and more new SCSI drives will require initiator identification.

> that it was not possible to boot from an arbitrated drive because TOS
> would not allow it and that a driver could not fix this problem. Does
> link96 with HD Driver solve this issue once and for all?

Yes, but only for drives connect to the ACSI bus. In this case not the hard disk driver is responsible for supplying a SCSI ID, the LINK96 does it on its own. Because for ACSI the LINK96 supports initiator identification on its own TOS is able to read the root sector of any drive and thus can boot from any drive. With initiator identification provided by the hard disk driver (TT and Falcon SCSI) TOS cannot read the root sector because TOS has its won SCSI routines and those do not support initiator identification. This means that drives like the Quantum Fireball are only recognized _after_ a driver with initiator identification support was loaded.

> Do you have an e-mail address for the dev of Link96?

e-mail: norwiecz@aol.com or http://members.aol.com/norwiecz/index.html

Note that Norbert Wieczorek is also working on an SCSI based ethernet card for Ataris and on an ISDN card. (The latter one probably less interesting abroad but mainly for German users.)

Source record: 130440

Well...

First ST's disk format wasn't really DOS compatible. The best way to get back the files is to format some others disks on a PC (or a 1990 STe/falcon), and ask a friend with another ST to copy files onto these disks (don't forget to format in double density, not high).

If you want you will install the HD controller, I suppose TEAC drives
are quite reliable (atleast other drives can be hard to get working).
But if you will just use new HD drive as a DD replace then almost any
HD drive works.

Take Care, Miika

Yes.

On the Mac:

1. Get PC-Exchange (free system extension, go to http://www.download.com )
and format a floppy as 720 Kb DOS.

On the ST:

2. Save c-lab stuff as a MIDI file on the floppy.

You can without problems use toner for the TEC LB 1301. This is the same
toner cartridge as originally used in the Atari SLM 804 laser printer.

The same is true for the OPC-kit, ask for TEC LB 1301!

Yes CAB.OVL for Mintnet (v.1.77). is it available a newer version?

>

I think CAB doesn't have yet built in FTP client. ATM you should use
an external FTP client.

If you use Mintnet you can try AFTP.
AFTP understand the pass of the URL as parameter, so if you select in
a CAB page a ftp link, AFTP login and open automatically the URL path.

ciao,

Lodovico

## 521. 9090 The dance planet EDITOR:

Hi faehnle.3@osu.edu, on 07 Jan 97 you wrote:

f> How do I limit the amount of memory that a program is allowed to take
f> in magic? Every time I run pagestream, it gobbles up all 14mb of my
f> free TT ram!

There is a program supplied in the MagiC distribution called LIMITMEM. This
will fix these old programs which think they are single tasking.

## 523. "language cookie"- How/where?

Newsgroup: comp.sys.atari.st
Date: 1997-01-09 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d54e1aa4091@sn.no>
Source record: 130459

Trying out a small HTML utility called "html help" I got the message "couldn't find language cookie, <English> <German>?" The program worked fine after choosing the desired language, but how exactly do I set the language cookie on my STe? Is there any particular program around for it?

There were no docs with the "html help" program.

Message-ID: <32D55949.79BA@gatwick.geoquest.slb.com>
Source record: 130463

For Falcon users I would hope that it would be possible to set M_PLAYER
to use Griff's mpeg player as a module - unless M_PLAYER can be written
to play MPEGs better/faster than Griff's.

What the Atari scene needs is the minimum duplication of effort, and the
maximum writing of complimentary products.
On the other hand this does tend to make installation and support more
cumbersome.

Actually, the PC I used when I was trying to read the disks was running
Windows 95. I've been informed by the many kind souls who emailed me
in response to my wail of distress that the early model ST I had was
not DOS-compatible, though later models were.

However, someone has offered to retrieve my files if I send him the
disks, and so, hopefully, the magnum opus of my college career will
shortly be restored to me. Thanks very much to everyone who responded!
Atari people are the salt of the earth, or at the very least, of
USENET, and I gratefully salute you!

Oh no! I thought this was a proper GEM program. I hate those .ttp things-
it makes everything so complicated and un-Atari like if you know what I
mean (reminds me of PCs) ;-)
I had a look around at that site and it seems that the PC and Mac versions
are proper programs. Does anyone know if the Atari version will become a
more user-friendly program than a plain .ttp?

[...]

>From what I understand, the Csound programming language compiles a series

Sounds a bit complicated. I didn't really know what it was, so I just
wanted to check it out.
I did visit the site you quoted, but it was extremely slow, so I gave it up
after a while.

## 535. MagicPC Demo - drive corruption

Newsgroup: comp.sys.atari.st
Date: 1997-01-10 00:00:00 UTC
From: Michael Clemmetsen <michael.clemmetsen@sunderland.ac.uk>
Message-ID: <01bbff12$ee866560$80dfe49d@m_clemmetsen_pc.ac.uk>
Source record: 130320

Hi all,

I've been tinkering on and off with the MagicPC demo on my PC at work and would suggest that people be wary of buying the full version unless they are sure the following has been fixed:

If you are using the virtual C drive in the Magic PC folder - disc_c.mpc (the demo only allows this type of disk access, perhaps the full version allows you direct access to the host filesystem), then it tends to become corrupted when it's nearly full. First you notice that files and folders are not properly deleted and are replaced with garbage filenames of garbage size, then the next thing is the system wont start claiming that the filesystem driver cannot be found (probably because it has been corrupted). The only way round this is to re-install the demo creating a new disc_c.mpc and thereby losing the entire contents of the old one. Obviously no one wants this to happen to their data when they are using the system seriously.

The only explanation I can come up for this is that the demo only allows a limited disc_c.mpc size and has problems maintaining this restriction. Has any one else seen this behaviour?

Michael

Hi Keith, this is Richard Karsmakers, "The Ultimate Virus Killer". You've been infected with the "Carpe Diem" virus; it's a hybrid link virus kind of thing. I have enclosed the removal instructions below. I would advise you to get your hands on UVK version 6.9 or higher. I will be finishing 7.0 in a week from now. What country are you in?

Instructions below:

HOW TO GET RID OF THE CARPE DIEM VIRUS

You have to remember that, on an infected system, there are a potential number of three copies of the virus: One on your floppy disk, one in the hard drive C:\AUTO\ folder and one in memory. These are the steps to get rid of the virus:
1) First you have to reboot without a disk, or with a disk that is guaranteed to be virus-free. Turn your system off for half a minute. These two measures will get rid of two of the possible three copies of the virus in your system (in your computer's memory and on floppy). Make sure the floppy disk is write-protected.
2) Turn your computer back on. Press [CONTROL] during the booting process. This way - at least with the Atari hard disk driver - the hard disk will be installed and accessible, but the programs in the \AUTO\ folder will *not* be executed. If you have another hard disk driver installed, simply try to bypass hard disk installation altogether (pressing [CONTROL], [LEFT SHIFT] and [ALTERNATE] simultaneously usually ought to do the job) and install the hard disk driver from floppy. This, too, will not install any of the \AUTO\ folder programs. If you have a Claus Brod hard disk driver installed, all you need to do is simply boot off another partition, like D:, by pressing the [D] key while booting.
This way, the virus will *not* install itself in memory. The virus will still be on the hard disk, but it won't be activated and you are quite safe.
3) Now you have to get rid of a file called "~.PRG" in the \AUTO\ folder of hard disk partition C:. It can't be located anywhere else. Unfortunately, the file is hidden. That means you usually can't delete it until you can see it, and you can't normally see it. These are a few ways to delete it:

i) With "GfA Basic".
Go into "direct mode", "chdrive" to drive C and "chdir" to the \AUTO\ folder. Now, with "files", you can display the full directory, including "~.PRG". Now use the "kill" command to delete it.
ii) With the alternative file selector "Selectric".
Turn the "display hidden" option on, and simply delete the file from "Selectric" itself. "Selectric" can be started from the desktop, without needing to start it from the AUTO folder. You might have to switch to a higher resolution first, though.
iii) In the absence of the two options mentioned above, you can use any command line interpreter (such as "COMMAND.PRG").
These may not allow you to actually delete the file, but don't panic. They *will* allow the "ren" command, with which you can rename the file, for example to "~.XXX". This will not remove the file from the \AUTO\ folder, but will render it *completely harmless* - after all, only programs with the ".PRG" extension are run when the \AUTO\ folder is invoked.
4) Now, with a clean and uninfected system (memory and hard disk), you can get rid of all occurrences of the virus on all your floppy disks with the "Ultimate Virus Killer".

If you have any further questions, don't hesitate to ask more...

All the best for 1997...may this be your first and *last* virus-related experience!

Please share with us all that you know about the modern day operating system used on Atari computers that gives you the authority to make such a statement.

>No, sir.. I am not an asshole!

This of course is debateable.

>I can't see why there would be a market for the
>$2700 040 Hades/Direct platform..

Because there are very powerful applications available for the Atari platform that are simply not available on Mac or PC. Your pricing is again wrong. $2700.00 US will buy a very nice DirecT60, a 68040 is cheaper yet.

All the best,
Chris @ Computer Direct

>
>An interesting idea, that. That said, this latest batch of address
>colection was built by newsgroup scanning, so what do we do in these
>instances?

Start by modifying your email address on posts that you make (notice mine?
I used to get as many as a dozen email spams per /hour/ - now I get perhaps
4 per week, and that usually right after cancelling an off-topic post in
alt.binaries.atari, where I have to use my "real" address).

Then make a habit of examining the headers of all the e-spam you get, and
complain to postmaster@domain of EVERY domain that appears in the headers.
At least one of them will be the right one - and the rest may eventually
institute some sort of anti-e-spam filters just to prevent all the
complaints that come their way.

In your complaint, always be polite, but firm, and ask that they pass the
complaint along to the proper place - my usual comment is something like:

The following unsolicited commercial email apparently origianted at or
passed through your service. If it did not originate at your site, please
pas this complaint to the originating ISP; if it did originate at your
service, please take appropriate action to prevent future abuse of the email
system and violation of Title 47 USC para 227.

(include complete spam here, with full headers)

You have access to a PC, so get Norton Utilities and use them to re-write
the boot sector (AND ONLY THE BOOT SECTOR!) of the floppies. There's a
couple of bytes that TOS didn't bother with in versions before 1.4, and that
Messy-DOS-style systems can't do without.

Your 1st Word files will still be in a formated that other WP software
doesn't properly understand, but you should be able to load the files, strip
out the formatting info in the header, and save the resulting plain text on
the Mac or PC hard drive.

If all else fails, email me for my snail address, and I'll convert the files
for you.

Hi Dave,

I got a program called BitMaker from Toad a while ago. It makes bitmapped font files for Type1 Postscript files. This makes the screen draw a lot quicker for characters at certain pixel heights.

> the Be OS with no legacy to deal with will kick ass!

You *do* know that Apple have announced that they are not going to adopt BeOS which is apparently very well thought out and fast (as any new OS should be). Instead they are going to use NeXT which is based on Unix. At least you might get a stable OS now. Linux is cool - quick, stable and well supported.

> No, sir.. I am not an asshole! A realist who had to let go of the Amiga which
> was awesome in it's time.

HP (second biggest computer company last year and probably the biggest in a few years) bought some amiga stuff recently (maybe a year ago) so that they could develop better graphics capabilities for their computers.

The price/performance hardware may be plummeting, but Windows and MacOS go the other way at a slightly slower rate, the powermacs we have here are ridiculously slow at even scrolling a telnet window!

> Be a realist and let go...
Quite.

Now think about this, you are saying that people shouldn't hand on to
their old and musty games. But then you turn around and say that they
should sell them to you.

You want the games, you go through proper channels and ask to make an
offer on private e-mail. This is a business, no time for games.

From: dipching@ping.be
Message-ID: <852928986_OASIS_@ping.be>
Source record: 130335

In response to the old question somebody asked a little time ago about
Dip switches in the Mega STE (Also TT referenced):

* Dip 1 is intended for a faster CPU speed e.g. CaTTamaran 48mHz
installed.
* Dip 7 is only for a high density installed unit; then the format
dialog in TOS will give the HD option.
* Dip 8 is for a machine with DMA Sound Off.

That's all I know about; to go further you may read ST-Computer 9/91
page 100 (german magazine).

I hope it will answer to this endless enigma (ELP ...)

Source record: 130336

Christian... 3 bombs is an address error, something is wrong with a program that is running, or trying to run. If these bombs are coming up after your auto folder has executed then the likelihood is a corrupted Accessory file. Try eliminating all your accessories and then add them back in one by one until the problem recurs. You'll have your culprint then I suspect. If it's occurring while your Auto folder programs are executing, do the same thing. Eliminate all your files and then add them back into your configuration until the problem recurs.

Keith Brooks

Nah, thats the tag for bold text. I've loaded many pages into CAB with
that tag in them without a problem.

I've had some nagging problems with some pages though. I don't know how
much help compiling this list will be to the authors, but I'll surely
contribute to it if they think it is helpful.

for a specific item, I may well have it!!!

I am sadly selling the Majority of my Atari equipment as I am moving
over to the Macintosh (with MMac) and much of it is not of much use on
that machine. All software is original and comes with manuals, virtually
everything is the latest version available or very close to it.
Prices are negociable if you are buying more than a few items and
prices don't include P&P, I'm in Bristol if anyone is close enough to
pick up. I only have one copy of everything so mail me ASAP if
you are interested, just reply to this message. Here goes:

STfm-520 upgraded to 2 Megabytes (upgradable to 4 Meg with SIMMS), TOS
1.4, Golden Image Mouse very good condition and hardly used, 90 UKP.
Will supply all the FREE PD software you could ever need too!!!

SC1224 Colour Monitor 50 UKP.

Cumana External Disk Drive, 15 UKP.

STFM, SC1224 & Disk Drive, 130 UKP.

**********

That's Write V3-The last version of this very powerful word processor,
can use (and comes with) Speedo Vector Fonts will no need for
Speedo GDOS, uptp 8 documents can be open, full spelling
checker and instant correction, macros, picture import and far
too many functions to list, a huge powerul beast of a word
processor, needs at least 2 meg and 2 floppy drives. cost 130
UKP, selling for 50 UKP.

Datalite 2-"On The Fly" Hard and Floppy Disk Compressor can compress by up to
220%. 10 UKP.

Diamond Edge 2.04-The ultimate Hard Disk utility, if you have a hard disk then you MUST get this. This will optimise your hard drive for writing or reading, recover deleted files, partition drives, retrive lost information, mirror FAT information, check drives and basically make sure your Hard Drive runs as fast as it can and you can recover 99% of data you thought was gone forever. 20 UKP

Diamond Back 3-Top rated Hard Disk backup pacage, can backup (with compression!) to floppy disk, removeable drive, partitions or tape drives. 15 UKP.

Hisoft C Interpreter-Interpereted C so no waiting for the Compiler to finish, complete with 2 DS disks and 340 page manual worth 50 UKP. 10 UKP

Hisoft Lattice C V5.5-The most comprehensive and powerful C compiler on the Atari, cost 180 UKP (includers WERCS, 1000+ page documentation AND The Dabhand Guide to C). 40 UKP.

Connect 2.46-The leading Terminal package for the Atari, FULL registered version inclusive of manual. 10 UKP.

Extendos Pro 2.4-By far the best CD Driver for the atari, will let you use virtually any SCSI CD ROM on the Atari range of computers. 10 UKP.

Fastcopy Pro-The fastest floppy copier that actually works, highly acclaimed by many magazines and used by almost everyone, if you don't have it and copy lots of floppies then you really should get it. 10 UKP.

Xboot V3-The premier boot manager, manages the Auto Folder, ACCs, CPXs and virtually anything you can throw at it. 10 UKP.

Quartet-4 track song construction utility, uses samples as instruments to create great tunes, like Sound Tracker but with an easy interface. 5 UKP (10 UKP with STFM stereo output cart).

Stereo Master-Stereo sample editor, recorder and real time audio effects package, includes sampling hardware. 15 UKP.

Mastersound 2-Sample editing and recording utility, also has a mixing editor where you can create very simple songs from the sameples used. 10 UKP.

Stereo Replay-Stereo sound sampling and output at superb quality (upto 48khz) all within a GEM interface with superb editing facilities. A top quality proffesional package, cost 80 UKP. 20 UKP.

Tempus 2-The fastest text editor EVER, a good all round editor but especially great for fast editing of large files, almost 100% machine code for unbelieveable speed. 10 UKP.

View II-Install this program and it will allow you to double click on text, pictures, sound samples, archives and .seq/.dlt animations and have them displayed straight from the desktop with no extra software. Also includes a ramdisk, 8 UKP.

Ease 4-The highly acclaimed desktop replacement, allows files to be moved to the desktop, any key can be a hotkey, drag and drop support, displays files in windows, TOS programs run in windows, GDOS fonts can be used for display, display mode can be set for each window, file searching, copy functions can be passed to Kobold etc. All in all a very competent desktop. 20 UKP.

MagiC 4-Multitasking for any Atari with no slowdown! Give each program as much memory and processor time as YOU want it to have and still retain high levels of compatability. Will run virtually every GEM program and many more and even makes your computer faster when running just one program. 30 UKP.

Kobold 2.5-The fastest way to copy, move, format, backup & delete files. Improves over the GEM rate by many times, has the ability to record actions for editing and repetition at a later date. A highly useful tool for floppy and hard drive users alike, intergrates seamlessly into Ease. 25 UKP.

Ease, Magic & Kobold-60 UKP.

Atari CDs:
Atari Mega Archive 2-The entire contents of the Umich archive as of May '95 around 2 gig of software in total. 15 UKP.

Suzy B's Atari Software Treasury-A 2 disk set of some of the best Atari software available. 25 UKP.

Crawly Crypt Vol 1-A top set of quality items from the Crawly Crypt BBS. 15 UKP.

Crawly Crypt Vol 2-Another set of top software from the Crawly Crypt BBS. 15 UKP.

Skyline-A compilation of German shareware along with some full versions of shareware such as: OCR 1.3, Maxidat, Tempus Word Jnr, GemFont, Idealist & Paula. 15 UKP.

Compo STe Power CD-Another selection of top German shareware along with a few full versions such as: Maxidat, 7 Up, Gem View, Original, Studio Convert & Adress. 15 UKP.

Skyline & Compo STe Power CD, 25 UKP.

**********
Blank (DD and HD) disk available, large quantities available please ask for prices if interested.

Issues of ST Format 6-72 (with cover & subscriber disks), 1 UKP each.
Atari World (with disks) Issues 6,7,9 & 11. 1.50 UKP.

Most issues of ST Review & ST User also available with disks for 1 UKP each, please ask fo the issues that you want.

1000's of PD software titles available, please ask for specific items or ask for a list it is 700k in size but comes compressed to around 400k. It can also be downloaded by pointing your browser at http://www.pwomar.demon.co.uk/main.tos

**********
GAMES!!!

Lynx Games, sadly most games come unboxed and without manuals but they are are only 5 UKP each:
Klax,
Zarlor Mercenary,
Gates of Zendocon,
Xenophobe,
Chips Challenge,
Slime World,
Ms Pacman,
Crystal Mines 2,

All games are £0.50(+50p P&P Overall) each unless stated. Most games come without boxes but with manuals.

A.P.B. £1,
Another World £1,
Archipelagos,
Atomic Robokid £0.80,
Axel's Magic Hammer,
Baal £0.80,
Back To The Future 2,
Backlash,
Bombuzal,
Boulderdash+Construction Kit,
Cannon Fodder £3,
Carrier Command,
Cruise For A Corpse £4,
Championship Water Skiing,
Damocles (Mercenery 2),
Dragon Ninja,
Dragons Lair 2 £3.50,
Eliminator,
Encounter,
Epic £2.50,
Final Fight £1,
Fire & Forget,
Fish,
Foundations Waste £0.80,

Future Basketball,
Future Bike Simulator,
Garfield-"Big,Fat,Hairy Deal",
Ghostbusters 2 £2.50,
Gremlins 2,
Hostages,
Hudson Hawk,
Indoor Sports,
Las Vegas,
Lemmings,
Licence To Kill,
Mercenery III,
Mig-29m Super Falcrum (Flight Sim') £3,
Mindbender,
Monkey Island (1 Meg Only) £5,
New Zealand Story,
Night Shift £2,
Operation Thunderbolt £1,
Operation Wolf,
Parasol Stars £1,
Populous & The Promised Lands £1,
Power Drift £1.50,
Power Up (Rainbow Islands, Chase HQ, Turrican, Altered Beast & X-Out) £3,
Precious Metal Collection (Captain Blood, Arkanoid 2, Xenon, Super Hang On) £2,
Rick Dangerous 2,
Risk,
Road Runner,
Robocop 3 £3,
Run The Gauntlet,
Shoot 'em Up Construction Kit,
Sleepwalker £2,
Soldier of Light (Not STe),
Star Wars,
Starray & Star Goose,
Story So Far V3 (Space Harrier, Live 'n' Let Die, Bomb jack & Thundercats) £2,
Super Space Invaders £1.50,
Superman £1,
Switchblade 2,
Switchblade,
Teenage Mutant Hero Turtles,
The Simpsons £1,
Triad Volume 1 (Defender of the Crown, Barbarian, Starglider) £2,
Turrican 2,
Venus The Fly Trap £1.25,
WWF Wrestlemania £1,
Wanted,
Xenon 2,
Yogi's Great Escape,
Zak McRacken and Alien Mindbenders (Lucasfilm Adventure) £5.

There's another called HTML Help. Same author, different purpose. From
Jaapan (Matthias Jaap's home page):

Utility; Converts between Atari-, Windows(ANSI)- and
HTML-special-characters, great Info-function, converts whole paths and 1st
Guide-files into HTML-files and any more...
Bilingual: German/English.

>>fine after choosing the desired language, but how exactly do I set the

>-That's it!
>Perhaps 'cookie' was bad thermology?

No, it's really looking for a cookie. AFAIK, only the Falcon generates this
particular cookie automagically. We need a nice AUTO folder program to add
the cookie on earlier TOS machines. Perhaps Mattias could write one?

Perhaps in Europe, but the two TTs I have had only the fan on the PSU. I say "had" as one of the TT motherboards is now in a Tower case with dual fans. ;^)

and so is this one.

> investor.msn.com ( jpg and gif )

This one is apparently another attempt by MicroSlop to "convert" Netscape
users - I'm on a direct 10 Mbps link using Netscape Gold 3.0/Win95, and all
I get is a blank screen with a horizontal line across the top. The source
code looks normal enough, beats me what those idiots are up to.

Ooops, spoke too soon! It finally came up with some graphics - but with a
fast link like I have here, it should have been almost instantaneous.
Instead, it took nearly a minute and a half. Blame a lousy server on their
end - dollars to doughnuts they're running a WinNT Web server.

## 571. PPP kit and Demon Accounts

Newsgroup: comp.sys.atari.st
Date: 1997-01-10 00:00:00 UTC
From: gary@imco.demon.co.uk
Message-ID: <852914262_OASIS_@imco.demon.co.uk>
Source record: 130356

Well, I've given up with STIK and the various Cab.ovl's, none of them seem to work properly with CAB 1.5 (which I love) and installed the CAB PPP-kit/Mintnet thing. This works fine once I get a connection but getting the connection in the first place is a bit of a problem. When I dial up with connect.scr, if the line rings before connection it works fine if it doesn't my IP address is returned incorrectly and the modem hangs up. I seem to remember there is some sort of problem with some of the modems at Demon's end which has caused problems in the past. Does anyone know of a CHATFILE that works for all Demon modems?

I'm using a TOS 1.4 STFM with 4Megs of RAM and here's the chatfile I'm using ATM:

```
ABORT 'NO DIALTONE'
ABORT 'NO CARRIER'
ABORT BUSY
ABORT WAIT
ABORT DELAYED
ABORT FORBIDDEN
"" atz
OK atdt01933709666
CONNECT ""
gin: imco
word: mypassword
ocol: PPP
```

Now that I've got Mintnet to work (18th attempt) are there any other worthwhile internet clients that I can use with a single tasking GEM or Geneva without a minix fs partition on my drive? I've thought about Gluestik but MGFTP 1.03 isn't very reliable, Antmail won't do STMP and Newsie is flakey (to say the least). I want to get away from Oasis 1.35 due to it's non-complient newsreader and wobbly GEM interface. I've never got any of the Oasis 2.XX variants to work on my machine. It would be really nice if I could surf (wade) the WEB while my mail flows in and out and news is gathered, perhaps with a couple of ftp and telnet sessions on the go as well. An unrealistic dream?

Top marks to Alexander for CAB (a fine peice of work, I've registered) No points for Oasis ('cos it's never lived up to it's promises, what happened to Spider eh?).

Thanks, Gaz.

## 572. New Emulator for the PC

Newsgroup: comp.sys.atari.st
Date: 1997-01-10 00:00:00 UTC
From: DaPhoenix <daphoenix@geocities.com>
Message-ID: <32D6B831.1421@geocities.com>
Source record: 130357
Cross-posted to: comp.sys.amiga.games,comp.sys.acorn.games,comp.sys.atari.st

I'm looking for people who know how to program emulators and/or IRC bots and proggies, and couriers.

If you can and like doing this, consider e-mailing me and joining KOD - The Knights Of Darkness, a new programmers guild that I have started.

We are currently working on a multi-gaming-platform emulator. Our progress thus far is quite promising, but we need more manpower with good experience to help us.

We also have other goals: IRC Superbots
IBM/Mac Emulator

If interested, please e-mail me.

>>I can't see why there would be a market for the
>>$2700 040 Hades/Direct platform..

Maybe it's the same reason why there's a market for the Machintosh which is compatible with absolutely nothing.

>Because there are very powerful applications available for the Atari
>platform that are simply not available on Mac or PC. Your pricing is
>again wrong. $2700.00 US will buy a very nice DirecT60, a 68040 is
>cheaper yet.

Oh Chris...do tell him about the thing you're working on. You know, a plug in card that's coming out which will let DirecT and other such computers run Windows 95 on a Pentium or Cyrix. I know that it's still in production, but to me is a major milestone in Atari computing. It even plays all the games!

As for the PowerMac...let's see, still PC compatibilty without getting a 486 card. (The Intel that's no longer produced). Still waiting for Apple and IBM to quit licking the wounds other companies inflicted on them, for that ability to run Intel based programs the same way that Mac programs are run. And before anyone tells me about these glorious PPC servers that run Windoze NT, try to run a game of Quake on it.

So if DirecT/40's can run all DOS and Windoze programs as well as TOS and PowerMacs can only run Mac apps...I think you better go back and read all the facts son.

Interesting question :) I'm toying with upgrading from v3 to v4 too, but
I've been waiting to give any bugs a chance to be sorted before I buy
it. How stable is v4? Is anyone use it with a Falcon/Magic5? I tried the
demo and it crashed a few times (which is what prompted me to wait).
Any views would be much appreciated!

I'm not sure how to set connect.num up because I don't use it. I use
CoSTa (obviously :) )
If I understand you correctly, if you were connected for, say, 2
seconds, your charge would be 0.40 + 2*0.23 = 0.86! Is that correct?

I'm always looking for ideas to improve CoSTa, and I could put a 'base
charge' facility in it which would solve the above (for you and anyone
else in a country that has pricing like this).
Let me know if you (or anyone else) fancies it!

There was a thread on the question of the Atari clock and the year 2000 a few months ago. It died out without any conclusions AFAIR. I don't understand how the clock is set up in the computer but is it not possible to produce a new clock CPX to display a four digit year figure even though the internal clock may only be capable of a two digit rendering of the year ?

Your dealer is obviously misinformed. I do not know of another programmer
in the Atari market that upgrades as often as the author of HD Driver.

Yes, sometimes he upgrades too often! We call him insane, in a nice way!

HD Driver is available in North America from us, in the UK from System
Solutions and I am not sure about other European markets.

ICD is old stuff for what it's worth, they have not upgraded for over
two years at least.

All the best,
Chris @ Computer Direct

If you go back and look at the original post, he stated he had a sales
receipt and that no one questioned the fact that he had paid for the
product. You are now saying you do question that. Then why didn't
you allow him to send the receipt to you and provide the support he
needed? If you have a known problem with Toad, then you should remove
their name from your list of dealers until that conflict is ironed

out. To send customers to Toad and then not provide support is wrong, no matter how small or large your company is. I have worked 800 support for a mini computer manufacurer and I can tell you I have given support to customers without being able to verify their contract. We charged $200 per hour, two hour minimun. Our greatest concern was taking care of the customer. After the fact, if I could not verify coverage, I would then send a bill. This is just my opinion.

> schreib@osuunx.ucc.okstate.edu

Hi Allen,

You can run Gemulator 96 with a TOS image file. You can use the
TOSdump program which you can find on the Unofficial STonX Page.
Gemulator does not have an option to load a TOS image file from
disk, so you will have to rename it magic_pc.os. When you then
search for MagiC, Gemulator will think that it is using Magic when
infact it is using TOS.

Despite the speed of MagiC on my Falcon I find that a TOS 2.06
image runs faster on the Gemualtor than MagiC.

Hope this helps,

Yours,

Ben Hills.

Hi Janet,

I'm not sure what you used when you tried to acess the Atari Disks using a PC,
but apparently the disk format of Windows 95 has now become ST compatible and
so should to be able to read the Atari Disks.

Perhaps this is worth a try.

Your,

Ben Hills.

## 592. Problem Websites for CAB

Newsgroup: comp.sys.atari.st
Date: 1997-01-10 00:00:00 UTC
From: csilver@kendaco.telebyte.com.NOBULK
Message-ID: <5b4rc0$bav@news.telebyte.net>
Source record: 130401

Hi All,

This an attempt to identify problem Web sites for CAB/STiK. This is NOT
a SLAM. By finding tough sites, hopefully, this allows the CAB developers
to find bugs in the programs much like beta testers who give much helpful
input. With the helpful input of others here are some results:

www.qvc.com
www.pcquote.com
investor.msn.com ( jpg and gif )

CAB doesn't load any of the gif's. They are in the wwwcache as 69 byte
gif's, but they are Error messages. HTTP/1.0 486 no acceptable objects...
Obviously, Error messages aren't gif or jpeg formats.

www.multimedia.com

The first page loads fine "The World is a Dark and Scary Place".
In about 5 sec the second page loads automatically. Well, it's
corrupted and incomplete. Only one person I asked to view this page
was successfull. He's an Atari Computerist (nice term, eh?) Oddly
enough, the URL can be loaded if typed in directly.

photojournal.jpl.nasa.gov

Can be viewed with OVL v1.18, 1.21 stalls and creates 11 bombs if you
try the ESC key, at least on my system.

www.nationalgeographic.com

Incomplete Web page. Some get it some don't; "you be da Judge".

The system I'm using is a Falcon 14meg, TOS4.04, AES4.10 and wwwcache in a
RamDisk(speeds up downloads a bunch). CAB1.50_030/STiK1.12 OVL(various).

The trouble I had creating this post is the inconsistentices of results.
Many had troubles with some sites that others didn't. On some days they
didn't have problems, the next day they did. Obviously, it does depend on
your server, auto programs, acc's, TOS, add on boards, etc.

If you find problem sites, please respond to this post and we'll see...

In closing I would again like to say how pleased I am overall with CAB/STiK.
Thanks to all I've e-mailed and who have so courteously responded.

C'est la vie,

Charles

Yes, Apple is having some difficulties namely the Performas, which I think they
should scrap the name and call all models PowerMacintosh. People equate
Performas as crippled models which were true in the past, but no more.

I am not jumping ship to Wintel, to much legacy there.
July's release of Tempus will finally bring a native and multithreaded finder,
new internet features and the defunct Coplands look and feel. Much nicer than
Wintel 95 and TOS!

Nice to have Mac OS clones for choice. Develope's innovation and competition.
PowerComputing is the next Dell and will/should expand the Mac along with
Motorola in the Enterprise market. Will see 533Mhz Powermacs mid year along
with a $999 model-hopefuly not crippled by Apple. The Pentium will bee as high
as 225mhz by the same time frame. MMX is marketing and the PPC still exceeds.

Sales of Apple's Powermac line did well last quarter, but the lack of Powerbook
product and dismal sales of the Performas dragged Apple's bottom line down.
Hopefuly, with the PowerBook shipping volume this month, Apple can eliminate
their billion dollar back log with the PM9500's(short supply). Typical Apple.
Hopefully they will ship Hooper(PowerBook 3400 - the fastest laptop of all -
200MHZ! - subwoofer with four speakers, PCI)in volume- don't count on it until
mid year's quarter.

I know I will have the Be OS too. There are at least a dozen Be apps ready and
were shown at MacWorld.. By the time the Be OS is fit for consumption, my next

cheap Mac will be between 200-300Mhz for under $2000 - I am hoping $1500. With the Be OS with no legacy to deal with will kick ass!

No, sir.. I am not an asshole! A realist who had to let go of the Amiga which was awesome in it's time.

When the Be OS and Rhasopy are fit for consumption and the continous plunge of price/performance hardware, I can't see why there would be a market for the $2700 040 Hades/Direct platform..

Be a realist and let go...

GREETINGS..

A version with French manual is available from PARX, Paris. With Italian
manual from ByteService, with Swedish manual from Falcon Pro Center,
Bollebygd.
The German version you can get directly from me.

If it's been mothballed for a while, I take it it doesn't have a hard
drive or vector fonts package ? Define decent. Try old faithfull
"ST-Writer", which I still sometimes use. Then there's Marcel, a more
GEM-based effort. All this P.D./Shareware stuff should be at:

http://micros.hensa.ac.uk

For commercial stuff you might try:

Of course, M_PLAYER doesn't play files in a window, which is what the
original poster wanted. Seems like a good idea to me though.

There is a new French program called AVIPLAY that plays AVI and
Quicktime MOV files in a window - in colour in >=256 colours. It's all
in French but is not difficult to work out. It takes the unusual step
of delaying the soundtrack to match the frame-rate. This results in
movies often sounding like old 80s scratch records (n n n n Nineteen). I
have to admit that I think the old Windoze way of skipping frames is
better. It works on the Falcon, not sure about other machines cos I
can't read the manual. I downloaded it from 42BBS but haven't seen it
on the Net anywhere.

Regards
Martyn

## 603. Re: Cannot delete files..

Newsgroup: comp.sys.atari.st
Date: 1997-01-10 00:00:00 UTC
From: Michael Clemmetsen <michael.clemmetsen@sunderland.ac.uk>
Message-ID: <01bbfeed$dc0770c0$80dfe49d@m_clemmetsen_pc.ac.uk>
Source record: 130412

In my experience the amount of time I have spent playing around with disk editors and file recovery programs when something like has happened would have been much better spent backing up all my files onto floppies, reformatting and repartitioning the drive and starting again. This has the further advantage that you then have an up-to-date backup and have the chance to reorganise your drive. However I only use about 60MB of a 127MB drive - you may have much more to contend with.

>One of those days I went to a skiing area in the Bernese Oberland called
>the "Eiger, M�nch & Jungfrau top ski region", starting off with a lift
>called the "M�nnlichenbahn"- where I also bought my skiing ticket.
>.... and much to my amazement and joy I saw that they were using Atari
>computers there!!!! :-)

That's fantastic :-) I went to Hong Kong in the summer of 1993, and when I went to cross the harbour by ferry, I saw one of those business card machines that uses an ST! Right across the other side of the world :-) Then I started seeing them at train stations too. Cool!

>They were facing me from the rear end, so I couldn't exactly tell what kind
>of machines they were, but they looked like MegaSTE machines or TTs.
>(I haven't used either, but from looking at pictures of them they look very
>similar...?)

TTs have two cooling fans (one for PSU, one for HD) whereas MEGA STEs only have the PSU fan. You can tell by the number of vent grilles, and also, TTs are a classy cream colour as opposed to the standard Atari-grey. Oh yes, TTs have *two* serial (9-pin) sockets on the VME bus covering plate, unless they had graphic cards fitted there?

>Anyway, there were several of them in that office, and I could tell they
>were connected in a network by looking at the LAN connector on the back of
>them. I asked the woman selling me the ticket about them, but she knew
>nothing about them.

Ah, I've been in this situation too: seen my favourite machine in the most unlikely place, got really excited and nobody else knew a sausage about them ;-) This was especially true in Hong Kong, because they're a bunch of PC fanatics over there.

>I'm sure they were Ataris since the word "Atari" was moulded into the
>plastic of the monitor's back-side. What kind of monitor could this be? The
>usual SM-124 just has the "Atari" printed on a sticker as far as I can
>remember.

You should have jumped over the desk too have a better look! I think if they were MEGA STEs, those monitors were probably SM144s. A friend (hi Phil!) has one of those and I seem to recall saying how cool it looked (naturally, when seeing an Atari-owning friend the first thing you do is check out their system!)

>Just had to tell you guys this as I thought it was quite nice to see the
>computers we use every day in professional use!

Seems like there's a pretty good reason to go skiing in Switzerland ;-)

: corrupt. Does your computer have enough memory to run the program?

This means that the content of the file length field in
the file header is not the same as the physical length. This
happens when converting binaries like ascii text (cr-crlf etc.)
or when the trnsfer program alters the file length (xmodem).

Ciao,
Till

Source record: 130221

Hi, fellas! Please don't give up on Oasis 2.10: I've got it working
beautifully on my TT (4 Meg only, HSModem7, NVDI 4.1, MagiC 5 / TOS 3.05).

I've had to throw out ZControl, though; I don't know about Thing or
Freedom. Try it without each additional application in turn.

I find Oasis 2.1 is now very stable, where previously it didn't like
the presence of STiK.ACC (not-enabled).

Remember the story of Bruce's spider?

>my provider's site...). This site is for business clients only. Strangely
>enough, their second site, for individual subscribers, works fine:
>www.inter.nl.net.

Hi Marc,

This is one of the reasons I made the original post. To let users benchmark
their CAB/STiK setup against problem sites so that they may be able to see
if it's CAB/STiK or something else that is causing problems.

Both Web sites you mentioned were easily connected to with both my Falcon
and 1040ST, so you should be able to see www.nl.net. There isn't anything
unstable in the Website itself. Good luck :)

Falcon: CAB1.5_030/STiK1.12 OVL1.18/1.21
1040ST: CAB1.31/STiK1.08 OVL1.18 (Used as test)

Source record: 130231

I am looking for ANYONE that has the blueprints of the Atari SLM804 Lazer Printer...I got my hard drive working with the unit hooked up, but now the printer still has its red light on (NOT THE INTERFACE THAT STILL HAS A GREEN LIGHT ON WHERE IT SAYS POWER) and it won't shut off. My father is very good with fixing computers (he has fixed my STe before) and accessories so PLEASE help...I would be willing to pay for the mailing costs if necessary. Thanks...

>060 that is slow. Considering a Powermac 6400/180 can be had for $1199. Whats
>your excuse for the high price?

If you are going to be an ass and close minded about it, why should I
waste my time?

An 060 may be too slow for MacOS, hell, a PPC is too slow for MacOS,
but for TOS and Atari apps it is plenty fast.

Price is all relative. perhaps this machine is worth more to a certain market than a slower 1500.00 PowerMac is?

All the best,
Chris @ Computer Direct

# 623. FS: Atari Computer Goods! More Atari Stock! FREE Catalogs!

Check out my Updated Atari Catalogs and find More Atari stuff! I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! And for the Atari ST & newer Line of Computers We have updated the ST Catalogs most of all the ST Software Catalogs. Catalog updated and more Software Titles added such as Brand New copies of Ultima V for those of you fanatic Ultima Collectors for the ST & for those who like Battling in Mechanized Combat, their's BattleTech, OGRE & OMEGA! And for those of you with more productive things on your Mind, PrintMaster & PageSTream!

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking. And something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Also, on BSC's Home Page! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Page with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Page. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

From: claes.holmerup@p5.dada.ct.se
Message-ID: <ftn_2.200.136.5$fidonet.org_be6ddfe7_Claes.Holmerup@p5.dada.ct.se>
Source record: 130236

Hi everyone,

: >> After d/l Atari software thru a Mac the Atari gives me this
: >> message TOS Error # 35. Can someone tell me what this
: >> means?
TH> : That error # can mean different things. More than likely
TH> the file is : corrupt. Does your computer have enough memory
TH> to run the program?
TH> This means that the content of the file length field in
TH> the file header is not the same as the physical length. This
TH> happens when converting binaries like ascii text (cr-crlf
TH> etc.) or when the trnsfer program alters the file length
TH> (xmodem).

I've also found that TOS error #35 appears very often when the programs don't work with the TOS version in the computer, so if the program uses shortcuts instead of "legal" jumps it will crash on TOS-versions that have been bug-fixed or enhanced since the version the program was written on.

Best regards,

Claes

> had graphic cards fitted there?

My TT (TOS 3.05, probably a mid-to-late-1991/early-1992 manufacture) only
has one fan - for the PSU. The HDD fan is absent, and there's no grille on
the back fo the case either - however, as with the rest of the case, the
top of the HDD access bay has ventilation slots.

Oh, and the TT has a better keyboard than the Mega STE, with different
function keys, and mouse/joystick ports at opposite ends of the keyboard
rahter than tucked underneath at the back where it is difficult to plug
in correctly without having the cord go at nearly a 90-degree angle at
the plug end.

Cool! Actually I went to Hong Kong in 1993 as well, but in December!
I didn't notice any STs there though :-(
Were they STs as we see them, or did you happen to see the business card
machines having STs inside of them?

>>They were facing me from the rear end, so I couldn't exactly tell what kind
>>of machines they were, but they looked like MegaSTE machines or TTs.
>>(I haven't used either, but from looking at pictures of them they look very

>had graphic cards fitted there?

I tried to notice as much as I could while being there, but since I've
never used a MegaSTE or a TT it was kind of hard. What I especially noticed
was the LAN connector, and to my knowledge the MegaSTE doesn't LAN
capabilities (but perhaps with an additional VME card?).

I guess it must have been a TT since they're more "professional" and would
probably be the most likely candidate for an office- does the TT have a
built in LAN connector? How does it communicate if it does? Some special
sort of Atari standard as opposed to Novell or similar systems?

>>Anyway, there were several of them in that office, and I could tell they
>>were connected in a network by looking at the LAN connector on the back of

>
>Ah, I've been in this situation too: seen my favourite machine in the most unlikely
>place, got really excited and nobody else knew a sausage about them ;-) This was

>especially true in Hong Kong, because they're a bunch of PC fanatics over there.

Like the rest of the world unfortunately :-(
The problem is that most people using computers at work etc. today don't
have anything to compare them with- all they've been using are PCs, so they
think a computer is supposed to crash every 10 minutes etc.

>>I'm sure they were Ataris since the word "Atari" was moulded into the

>were MEGA STEs, those monitors were probably SM144s. A friend (hi Phil!) has one
>of those and I seem to recall saying how cool it looked (naturally, when seeing
>an Atari-owning friend the first thing you do is check out their system!)

Yeah- except that there was a window between the counter and the rest of
the office ;-)
I had a look at an old Atari brochure where there were brief introductions
to the TT, Mega, Transputer, Portfolio and PC computers.
From the picture I saw that they were using a totally different monitor
than the standard ST types. There's a monitor called the PTC-1426 which
apparently is a 14" colour monitor for the TT.

>>Just had to tell you guys this as I thought it was quite nice to see the

This message from julian@connexus.apana.org.au to All came in on a wing and a prayer...

Hi Julian!

j> I just got an SLM 804 with a system. I managed to get it to print out
j> using Calamus but it refuses to print out or 'see' the printer from
j> the desktop when I select 'print' after double clicking on a .txt
j> file.
j> I have the slm804.sys file in the root dir of C.
j> I think the assign.sys is ok.
j> I have gdos in the auto folder.

You can't print from the desktop with this setup, IIRC you have to add the Diablo emulator (which should have come with the printer) or the LaserBrain Epson emulator (which may be on the net somewhere, got mine from a PD Librar

Member, Madison Area Atari Users Group (MAAUG)

# 633. MagiC 4 WON'T install! PLEASE help!

Newsgroup: comp.sys.atari.st
Date: 1997-01-11 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <RZGWts7.johnhechtman@delphi.com>
Source record: 130276

I just paid $100 for MagiC 4 so I could do head-to-head comparisons with Geneva and Neodesk which I already own. I'm running a 14 meg Falcon with X-Boot 3 as a boot manager so I can set up various boot sequences and choose among them. Now I find that the MagiC install program breaks if I try and load it from floppy disk. It always breaks after calling for the second disk. I get the dialogue box asking for the second disk. I put the second disk in and click on the "OK" button or press return - but nothing happens! I'm stuck at the dialogue box unless I reboot!

This is true in any resolution and with NO other software loaded (bare boot). I've tried loading the files onto my hard drive manually, but then I get a prompt saying that MagiC must be "personalized" and to use the install program. I've also tried copying the files to my hard drive, copying the MagiC 2 folder into the same path as the MagiC 1 folder and the install program, so as to avoid having to make the disk switch (pretty sneaky, huh?). When I do this, I get a prompt saying that the installation was "successful" but when I try to run it my NEC 3D multisync just shows a broad black band (horizontal) and a similar broad white band. The system locks up and it's back to X-Boot to get my poor Falcon back together again.

Toad has offered to refund my money or replace the program, so it's not a total loss, but I'd still like to try MagiC. I emailed System Solutions and got NO response (thanks guys, that's what I call support! - NOT). ATM, I'm here running Geneva/Neodesk/NVDI and I have to say that all works pretty well. No bombs unless I do something reckless, X-Boot always can get me back together and Neodesk has a lovely set of keyboard equivalents. Plus, I got it all to work the first time - no $#@!ing around. So far the Neo/Geneva combo is a hero and MagiC 4 is a zero, but I'm stubborn enough to give it another try. What's the problem here? Bad disk? I doubt a software conflict as this occurs with no other software loaded. My Falcon has had the clock patch mod done by Wizztronics, I have the Wizztronics case w/a 250 W PSU, and I'm running TOS 4.04. If anyone makes any comments about my "boarderline" Falcon, I'm likely to reply with a comment about "shoddy programming". At least the Gribnif software works as advertised! What gives here?

The Be OS will contiunue to be developed for the PowerMac. PowerComputing will
ship a copy of the Be OS with all their units leaving the factory. At least 12
apps were shown at macWorld. Will see how it plays out. The Be OS is new,
moderm and has no legacy to deal with. Hopefuly with a decent web browser soon,
should put the Wintel/Mac to shame.

So what does this do to the Amiga? HP licensed some of C='s technology just
before they went under. About three years ago. C= at the time decided not to
go with PPC and instead use a HP risc processor.

## 637. Upgrading a Mega STe

Newsgroup: comp.sys.atari.st
Date: 1997-01-11 00:00:00 UTC
From: hohenstein@worldgate.com
Message-ID: <5b7jr6$de6@scanner.worldgate.com>
Source record: 130280

I've got a Stock Mega STe with 4 megs RAM and a 54 Meg HD. I want to improve the system, but I'm not willing to spend a LOT of money to do it. Last I tried to figure it out, it would cost me about $2000 or more, Canadian, to upgrade my Atari system to something web-worthy (falcon-like color, 8 or 16 megs). For that proce, I can buy a PC system.

Any suggestions?

Doug Hohenstein Without questions, there is no truth.

What are those apps? I made a mistake with pricing. But $2700 is a lot for an
060 that is slow. Considering a Powermac 6400/180 can be had for $1199. Whats
your excuse for the high price?

It certainly is.

> I copied the files from both disks onto my hard drive and attempted
> to run FRONTIER.PRG in ST-Low, but it just locked the machine. What

The problem with Frontier on a hard drive is that it uses some absolute
addresses. It's quite likely that it'll overwrite your HD cache, some
ACCs or whatever. A crash is a very likely result.

The way around that is to load a program, first thing in the auto folder,
which allocates a large amount of memory (IIRC, I use 512 kbyte).
Frontier will then overwrite that memory instead and nothing will happen.
:-)

>2. Is it normal for the autopilot, upon guiding the ship into a space
> station's docking bay, to smear you across the side of the station

The autopilot is rather unreliable for some things, if you run it at a
slow speed. Turn on maximum time speedup and things will usually be fine.

>3. This may also be from the missing card: how do you change your
> name from Jamison (which affects the savegame filename)?

Sorry, I don't remember that.

>CoSTa (obviously :) )
>If I understand you correctly, if you were connected for, say, 2
>seconds, your charge would be 0.40 + 2*0.23 = 0.86! Is that correct?

Oops! I did of course mean per minute! Yes, it would be calculated
like this:

1 minute 0.40 + 0.23 = 0.63
2 minutes 0.40 + (2 x 0.23) = 0.86
3 minutes 0.40 + (3 x 0.23) = 1.09

Perhaps someone else could help me set up the connect.num file?

## 648. Writing to Atari disks from a PC

Newsgroup: comp.sys.atari.st
Date: 1997-01-11 00:00:00 UTC
From: stever@mailzone.com
Message-ID: <32d6a571.15353772@news.easynet.co.uk>
Source record: 130291

I am wondering if anybody can help me.

I have a PC and I have a friend, with an Atari 520 ST with 1meg of RAM who wants to download some games off the Atari indexes online. I said that I would save him the hassle and download them for him and I intend to use RAWRITE. (this program should write to the disks sector by sector, ignoring format) RAWRITE is distributed with many Linux installations. (especially Slackware as far as I know) Can anyone confirm or deny that this willl work before we try? Or can somebody offer an alternate solution?

Many thanks,

Steve.

Why don;t you just use standard DD 3.5" discs and format them as 720Kb
discs on the PC. The ST is capable of reading these 9 sector/80 track
discs, so you can just copy the files straight onto the floppies like
normal files.

: Geneva and Neodesk which I already own. I'm running a 14 meg Falcon with
: X-Boot 3 as a boot manager so I can set up various boot sequences and choose
: among them. Now I find that the MagiC install program breaks if I try and load
: it from floppy disk. It always breaks after calling for the second disk. I
: get the dialogue box asking for the second disk. I put the second disk in and
: click on the "OK" button or press return - but nothing happens! I'm stuck at
: the dialogue box unless I reboot!
: What's the problem here? Bad disk?

Is this MagiC4 a younger or older release? I would ask for an exchange of
diskettes. Sometimes it just happens, that defect diskettes are
delivered. Exchanging diskettes would include a refresh to the latest
MagiC4 release as well. Perhaps the install.prg is buggy. Be sure you
type in the correct number for registration (some master diskettes had
two numbers confusing the users).
Did you backup the master disks? Sometimes you find out by copying that
diskettes have defect parts/data files.

I started with MagiC3 and recently updated to MagiC5 and both types
work/ed fine for me, although I have heard or read that the earliest
releases of MagiC4 still were a little buggy.

Bye,

Kerstin

## 662. Problems with MG-FTP

Newsgroup: comp.sys.atari.st
Date: 1997-01-11 00:00:00 UTC
From: afoster@zetnet.co.uk
Message-ID: <5b8np7$52n@irk.zetnet.co.uk>
Source record: 130305

Can anybody help with a problem I'm having with the FTP software I'm using? I can use all the other STiK stuff, apart from MG-FTP (v1.3?) which crashes before it displays anything. I've fiddled around with the settings, but it still only gets so far as displaying the server name on the window title bar, and 'no connection' on the info bar. Clicking on 'Open' makes it crash with two bombs.

What am I doing wrong? Please email me on afoster@zetnet.co.uk.
Thanks...

Message-ID: <19970111191800.OAA24753@ladder01.news.aol.com>
Source record: 130307

OK, here is and update on Toad and Gemulator:

according to Darek, Toad now sends in electronic registrations for their customers who buy Gemulator from them.

I am now 'registered'. I am not sure what effect that is going to have on the problems I have with Gemulator, but I can say, now, it is as safe to buy Gemulator from Toad, as it is from anyone else.

Also, Darek sent me a beta copy of Gemulator 4.6, which he does for registered users, (by now you may be able to download it from his web page as well)

so registering has had one positive effect so far.

Also, I like Gemulator. I would like it better without the problems, but I recommend it, regardless.

## 665. Logic Environment Guide

Source record: 130312
Cross-posted to: rec.music.makers.synth,alt.music.progressive,comp.music.midi,alt.music.synthpop,comp.sys.atari.st,rec.music.makers.synth,rec.music.synthrec.music.progressive

SMPTEtrack software from Hybrid Arts for Atari 1040S. Ataris have built-in MIDI, turn yours into a professional MIDI recording studio! Comes with with SYNCbox for SMPTE synchronization in and out. It is the most current version. Got all the doc's.

The software is professional-quality, 64 tracks, complete sync capabilities including chase sync. It is pretty powerful stuff. No MIDI cards are needed because the Atari has MIDI built in.

At $250 plus shipping, it's a much better deal than buying a PC or upgrading an existing PC to support MIDI, etc.

Let me know if y'all are interested. krestivo@baynetworks.com

Sorry for the spam, BTW, there's no really easy category to post this in. Thanks!

-ken

# 671. Re: High Density Floppy Disk Drives - MegaSTe

Newsgroup: comp.sys.atari.st
Date: 1997-01-11 00:00:00 UTC
From: Bob Matiska <bobmatiska@delphi.com>
Message-ID: <5zL1F40.bobmatiska@delphi.com>
Source record: 130314

I've been using Teac high density drive mechs for years with good results in my ST's as well as my Mega STe when I upgraded it. Just replacing the double density drive with the Teac will still give you double density, of course. If you want to use the drive in high density mode you also need Ajax drive controller chip instead of the 1772, PAL
chip C301901-002 (not the -001 chip; it's near the power supply) and of the bank of 8 dip switches, the 7th one needs to be flipped opposite the rest.

Good luck!

Bob

I have three Mega STe's and all of them have keyboards with the
mouse/joystick ports on opposite ends, just like my TT keyboard. I think
you're referring to the original Mega ST keyboard.

The biggest problem will be your apps. If they are 2000-ignorant, you'll have then telling you that it is 1900, and that it has been -36525 since you last used them. Or that you are owe -1200 in back taxes/bank fees.

System wise, disc files are stored by GEMDOS, and all GEMDOS dates are based around 1980 (as "year zero").

I am uncertain whether it uses signed arithmetic or not. If it does, this gives a range of -64 to +63 (which translates into 1916 to 2043). Unsigned arithmetic will give you a range of 0 to 127, (ie 1980 to 2107).

The best way to tell if you are going to be affected is to get the control panel, and change the time and date to 23:59 on December 31st, 1999. Wait for it to roll over into 2000. Now copy a file with the desktop (with "Keep date/time" switched off if you have a newer version (2.x, 3.x or 4.x) of TOS).

The file will now appear to be dated at midnight on 01-01-00 (meaning January 1st, 2000). We are safe - for the time being.

Advance it to 23:59 on December 31st 2043. Watch it - does it roll over to 2044, or back to 1916?

If it rolls over to 2044 you'll be OK till 2107. But there'll be problems in 2080, as the computer may think it is 1980, and you'll have problems entering dates into 2000-ignorant apps. And then in 2100 which is not a leap year, but 2000 is. But, if an ST or successor is still working by then, I'd be (pleasantly) surprised, so that's just a bit hypothetical.

My TT is OK for 2033 (that is the furthest date in the future I have tried, as it has some significance for me)

>
> Brett Smith

To my knowledge, the ST doesn't have a scsi port, unless you put an icd
link on it. But you can certainly hook them up via the serial port on
your mac and the serial port on the ST.

Also, if you get a program that puts the ibm boot sector on the old ST
disks, your performa should be able to read the disks directly.

Good luck

Tom

## 682. FS - Hardware/Software

Newsgroup: comp.sys.atari.st
Date: 1997-01-12 00:00:00 UTC
From: Tom Wilkinson <tommyboy@sun.pris.bc.ca>
Message-ID: <32D93A8F.71C0@sun.pris.bc.ca>
Source record: 130177

I have the following items for sale:

hardware:
520 ST - expanded to one meg with mouse - no disk drive or buy the
external ds drive below - $15. Comes with mouse.
sc1224 colour monitor $45
sc1224 colour monitor $30 (whites sometimes go to green on edges of
screen - doesn't seem to affect programs.
SM124 mono - expanded screen with swivel base - $25
SM124 mono - non swivel base $25

Stacey - 2 or 2.5 meg/20 meg hard drive - has problem with keyboard. We
were putting it back together after checking hard drive connection and
keys stopped working. Every time we tried reinserting the hard drive
cable, less keys worked. Got frustrated and shelved it. - offers

double sided external disk drive with working power supply. - $15
sh204 powers up but doesn't seem to boot properly. $15
Geniscan hand scanner with scanning software $15

Atari Jaguar plus seven games - wolf 3d, tempest 200, AVP, cybermorph,
dino dudes, raiden, zool 2. $100

software

dbman - (old version - dbase compatible database) $5
Hisoft Basic - latest version $30
Fleet Street Publisher 2 $10
Graphic Artist (cad program) $5
Personal Pascal $5
Clayton Walnum Cmanship with disk $5
ST Assembly language workshop with disk $5
Lattice C 5.xx(can't remember) $25
ST tacklebox (partner to Personal Pascal) $10
Personal Pascal $5
Also have about 25 or 30 of the Arrakis Advantage Educational Series
$5 each

Shipping from Canada to your address will be extra. I would say about
.75 per pound to the U.S. from past experiences.

All prices are in U.S. dollars.

Will look at all reasonable offers.

Tom

What kind of Falcon system do you have? And do you have an IDE hard
drive?

I've had an Atari 520ST for over 10 years and I was thinking of
getting a better one to play around with music. (My main computer has
been a PC since 1989). I called Toad Computers and the cheapest
machine they had was a C-Lab Falcon mkII with 4 MB of RAM and a 520 MB
hard drive and they wanted $1299 for it!

Regards,
Jamie

|||
Keep up the fight ||| I love my country
or lose the right... / | \ but I fear my government

It only stands to reason that where there's sacrifice, there's someone collecting the sacrificial offerings. Where there's service, there is someone being served. Make no mistake about it, the man who speaks to you of sacrifice is speaking of slaves and masters - and he intends to be the master.
-- Ayn Rand

---------- begin WAUG Flier attachment ----------

WAUG -- (Formerly 'The Washtenaw Atari Users Group')
(Now known simply as "WAUG")

What is WAUG? Over 12 years ago a few intrepid individuals decided to
============= start meeting regularly to share their enthusiasm and knowledge of computers and related hardware/software items. In June of 1987, after more than two years of unorganized and informal meetings, the members developed and formally accepted a club charter. Thus WAUG was born! Helping people get the most out of their computer is WAUG's purpose.

Initially, the club was dominated by Atari afficionados, however in June of '95 the executive board arranged to expand the club's resources to include IBM and Macintosh users. WAUG is an ideal place to meet with other persons who share your interests and to find answers to your questions about using your computer -- no matter what machine you own,

how old it is, or your level of expertise.

Who's involved? Since its inception, members from cities outside Ann
============== Arbor (including Westland, Canton, Livonia, Milford,
New Hudson, Dearborn, Hartford, and even as far away as
Toledo) have regularly attended the meetings. Some members live as far
away as central Michigan, and one member lived in Montana (!) and joined
simply because he enjoyed receiving our newsletter.

How do I join? Membership in WAUG has only one requirement: an active
============== interest in personal computers. Annual dues are $15,
for which the member receives free monthly issues of the
club newsletter, opportunites to win valuable door prizes, and reduced
rates on disks purchased from the club's Public Domain/Shareware disk
libraries.

What will I find? A different topic is featured each month: Printers,
================= Education, Telecomm & the Internet, Beginners Woes,
Desktop Publishing, Scanners, Swap Night, MIDI &
Music, and Utilities are typical examples of what you'll find when you
visit WAUG. Drawings for door prizes take place at every meeting, and
the annual Christmas Party Meeting is not to be missed. There is no
dress code in effect at any of the WAUG meetings -- tuxedos and ballroom
gowns are perfectly acceptable. (However if you choose to wear these, we
WILL stare at you!)

How to contact WAUG:
====================

WAUG
14 Payeur
Ann Arbor, MI
48108

Voice: 313/971-8576
Modem: 313/971-6035
E-Mail: molin@atari.archive.umich.edu
harvey@mail.ic.net
WWW: http://ic.net/~harvey/waug.htm/

or just show up at any regular monthly meeting! Visitors are
welcome and we promise not to pressure you to join until we've seen your
face at least three times!

Where does WAUG meet? Meetings are held regularly on the second Tuesday
====================== of each month at Colonial Lanes located on South
South Industrial St. (across from Kroger) between
Stadium and Eisenhower streets. Meetings start at 7:30pm and usually run
to approximately 10:00pm.

## 686. "Notator SL 3.21"- files missing

Newsgroup: comp.sys.atari.st
Date: 1997-01-12 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d95ef884d22@sn.no>
Source record: 130181

I was handed a copy of version 3.21 of the MIDI sequencer program "Notator SL", but unfortunately some files were missing. So I was wondering if someone here had the complete package with all files intact?

...before people start accusing me of pirating software I have to say that I already have the original program with the hardware "dongle" (copy protection device), and an upgrade won't work without it.

I also contacted Emagic, and they told me that they had no problem at all with me copying a more recent version of the program for my own use (they also don't support it any longer, so I couldn't get the upgrade from them).

** PS. Please don't send me UUencoded files or whatever before contacting me first. I'm not interested in getting 25 copies of it in my mailbox from different people ;-)

>It needs to be compatible with a Falcon running MagiC5.
>Does anyone know of a program that will do this for me?

I haven't tried it on a Falcon or Magic, but I have this program called
"LEDpanel" which I use myself. It can also show if the <CAPS-LOCK> key has
been pressed down and a whole lot of other things if you want it to.
You can put it in the AUTO folder.

Download it from:

ftp://ftp.sn.no/user/hallvart/atari/ledpa242.zip (18 Kbytes)

>disc?

Nope.
Desk accessories are programs which you can access at just about any time, within any other program! It's the closest the normal Atari TOS operating system gets to multi-tasking.
ACCessories have the extension .ACC and the reason why you confuse this with a boot-disk is probably because you need to boot with these ACCessories in order to install them.

That is, they need to be on the diskette, but not within any folder. The same goes for a harddisk.
When the computer has finished booting you will be able to access any of the accessories by going to the leftmost menu in the "menu-bar" of the screen. You can't have more than 6 ACCessories installed at once, but a newer form of ACCessory has been developed called "CPX modules".

A special ACCessory called "Xcontrol.ACC" (this replaces the "old" control panel ACCessory) is installed, and once this is in use you can load/unload different kind of "accessories" (called CPX modules- with the extension .CPX), and even have several modules installed in this one ACCessory!
Hope this clears things up a bit.

Hi All,

I am also using Papyrus 4.2x on the TT with MagiC 5 NVDI 4.1 works great in premtive mode. No crashes. The only problems are setting pap to load rtf or asci files from the desktop something has changed and the program crashes or refuses to load them as ver 3.65used to. Some of the RTF from MS word on the mac seem to cause problems.

All Pap need now is the word count turned on etc the rsc files are in the code.

Tables are also much faster in this version.

All I can say is GET IT!!!

I thought users use the OS to run apps. I suppose that different on the TOS
platform.

>
> Price is all relative. perhaps this machine is worth more to a certain market than a
slower 1500.00 PowerMac is?

I suppose. Must to be the ones with deep pockets. I highly doubt will be a
sustainable.. Considering the PowerMac hardware platform doesn't sit stil. Soon
MP boxes in the same price range as what you sell plus running the Be OS, Tempus
and Rhasopy..

>the clock is set up in the computer but is it not possible to produce a new
>clock CPX to display a four digit year figure even though the internal clock
>may only be capable of a two digit rendering of the year ?

The system clock keeps all four digits internally (unlike the PC or
the Mac). TOS-based systems do not have a problem with the Year 2000
"bug."

Anyone who has HighSoft BASIC can demonstrate this rather easily.

From the editor, compile and run this:

```
Print DATE$
```

You'll get a date with a 4-digit year.

Now run this:

```
DATE$="01-11-2001"
```

And run the first one again. You'll find the answer comes back in
full 4-digit year and the correct year. Your CPX may have a problem
displaying it, but the internal clock is correct.

> So, if there is anyone in PEI that uses an Atari/shell account,
>please write to me and I will get in touch with this friend of mine.

A shell account isn't a requirement (although a system that doesn't
offer one is NOT an ISP, IMHO - it's a WindowsNT ssytem collecting
money for Bill Gates).

If PPP is all that's offered, visit ftp.cnam.fr (or possibly my ftp
site, I honestly don't recall if I put it up yet) and get PPPKIT14.ZIP
(or is it .LZH?).

OTOH, if your friend only wants email, news, ftp and IRC (e.g., no Web
browser), get OASIS version 1.35 (the last one that worked for me) and
install that. It handles PPP and SLIP, and NOPS (the network layer)
is currently supported (again) by Mike DePetris in Italy.

Sorry, I'm not in PEI - Portland is MUCH nicer. <G>

atari army,

sorta a same message i posted before. but worse. i bought an atari mega30 hard drive, and now when i try to run anything (installed or not), i either get a three bomb error, or a TOS #35 error. my comp. is a 1040ST with 4megs, rom v.1.4. booting from the hard drive is a disaster. the computer just loops.... screen comes up showing driver version etc, three bombs appear, and then it resets and does the same thing over and over. leaving me to have to bypass the bootdrive, and re-formatting it so that i can at least get to my desktop. the drive seems to be fine, as there are only 6 "bad" reported clusters during the format process. but if i just turn on my computer and monitor, leave the hard drive off, and try to run software like i did before, i get errors. my original boot disk (the one i used before i got the hard drive) doesn't even work correctly anymore. when i try to load certain programs from the autofolder (like marpets cartridge clock acc.) i get an error. i still can't get neodesk to install, and i just shelled out BIG bucks for Cubase Score, which i'm not even gonna bother to try to install into this problem is fixed. please please please, any help would be appreciated. oh, the jarxxx.prg in neodesk never works for me. i'm........stranded.

let down,

chrisTiaN

Don;
Sorry to see you stop programming for the ST. I would however, like to thank you for continuing support of your products (even releasing them a freeware!). There have been so many good programmers who just vanished. What is in Spiritware's future?

Bob

>Clicking on 'Open' makes it crash with two bombs.
>

MG-FTP likes to run from a bare system, so switch off all multitasking and
reboot with only what you need -

Stik
hsmodem
patches

it is also better to have stik connected before trying to do anything with
mg-ftp, you have to enter all the setting before you can open

Also check that there is an empty folder with mg-ftp.prg called 'tmp'

mg-ftp is not the best proggy around but it does work :-)

The good news is that I heard on IRC last night that a beta of v2 is about,
so it should be around soon :-)

Yours Roy

# 712. Atari PPP!!! easy! 25 min to install. (hopefully) :)

Newsgroup: comp.sys.atari.st
Date: 1997-01-12 00:00:00 UTC
From: Katherine L Ellis <kellis@primenet.com>
Message-ID: <Pine.BSI.3.95.970112051206.10702A-100000@usr08.primenet.com>
Source record: 130248

Hi I am writting a doc for newbies: How to have PPP with atari
computer . Doc written the simplest way., Step by step, what to get,
what to change where to place.
If the documentation is well written you'll be able to set up a full
mint/mintnet/unix server with PPP protocol in 25 min maximum.
I am currently working on the documentation. I will need about 3
people to test the instructions of the documentation, then talk about
the possible changes if any confusion.
PPP is easy to set up with an atari, It is possible. I have it on my
megaste and my falcon.
The possible betatesters would need at least 1 free partition at least
40 meg and 4 meg of RAM. Less might be possible but that will be very
hard.
So if you are willing to try that with me, you are welcome..

On Fri, 10 Jan 1997, Bruce G. Klassen wrote:

did you try Aftp and Duftp?
Both are excellent and very very very fast!.
Almost as fast as Zmodem with the shell account!
Also Newsie 66 works very well. No problem at all.
but you need gluestik with newsie.

Hi
I just downloaded what looks like a great little program for creating your
own web pages.What I need to know is if it is possable to have
download-able files added to the pages created by this great program.
I also have HTMLHELP and one other program by the same author.
Is it also possable to make the pages larger...When I try to load
some gif images the program wont save the page.Any help on this subject
and any other pointers on creating a web page would be greatly appreciated.
Bye for now.....Ron Lukawitski

> 3 minutes 0.40 + (3 x 0.23) = 1.09
> 
> Perhaps someone else could help me set up the connect.num file?

Hi,

perhaps me? ;-)

You will need the new (not yet english) Connect 95.

There you can setup a connect.num file like this:

```
night: 18:00-06:00
day: 06:00-18:00

holiday: sat sun \
1.1. 1.5. 3.10. 24.12. 25.12. 26.12. 31.dec \
easter-2 easter+1 easter+39 easter+50 advent-17
workday: *

online: (t(8,2))

unit: 0.23
currency: NK

city: [1-9]*
far: 0*

City; $city, $day, $holiday; 0.40 + $unit * ceil( $online / 60 )
...
```

So it works - at least in the new version.

WOlfgang

Source record: 130254

Hello Christian,

chrisTiaN.a.h. (godpup@ix.netcom.com) wrote:
:
: sorta a same message i posted before. but worse. i bought an atari
: mega30 hard drive, and now when i try to run anything (installed or not),
: i either get a three bomb error, or a TOS #35 error. my comp. is a
: 1040ST with 4megs, rom v.1.4. booting from the hard drive is a disaster.

What kind of HD-driver do you use?

: the computer just loops.... screen comes up showing driver version etc,
: three bombs appear, and then it resets and does the same thing over and
: over.

Did you try to install the HD-driver without accessories, alternative
desktop etc., just the "naked" system perhaps with Z- or xcontrol and the
control panel only?
This sounds to me like an accessory or some program in the auto-directory
might be incompatible.

: leaving me to have to bypass the bootdrive, and re-formatting it
: so that i can at least get to my desktop. the drive seems to be fine, as
: there are only 6 "bad" reported clusters during the format process. but
: if i just turn on my computer and monitor, leave the hard drive off, and
: try to run software like i did before, i get errors.

_Never_, _never_ leave an ACSI-drive connected to the port with power
off! Pull the cable out! It causes errors.

: my original boot
: disk (the one i used before i got the hard drive) doesn't even work
: correctly anymore. when i try to load certain programs from the
: autofolder (like marpets cartridge clock acc.) i get an error.

This might be due to the ACSI-HD still connected to the interface.

: i still
: can't get neodesk to install, and i just shelled out BIG bucks for Cubase
: Score, which i'm not even gonna bother to try to install into this
: problem is fixed. please please please, any help would be appreciated.
: oh, the jarxxx.prg in neodesk never works for me. i'm........stranded.

If you can format the HD, access to it is working. So the reason for the
loops should be a buggy or incompatible program or HD-driver (or wrong
physical order of the auto-programs).
So try to calm down and at first start checking up step by step every

program which is loaded during boot-process (and if necessary, get an updated HD-driver).

Bye,

Kerstin

Have you already told Toad? Personally I find this quite amazing, as it might
be a Trojan horse but it does nothing else but plant the virus. There is no
game, no demo, no nothing to see. I reckon Toad would at least put stuff on a
CD that is known to *work*, wouldn't they? CARPDIEM.PRG does not work, except
for infecting your system.

Hi all,

I upgraded my 1Mb 1040 STf to 4Mb and all works OK except the one game I'd keep my ST for al time for !! :.-(

My copy of ANCOs Player Manager (Kick OFF2) no longer runs. It boots but when it comes to make a disk access it 2 bombs out.

I got another copy from ANCO (unbelievably after all this time!) and the same happens. I get no probs with any other major apps...?

I have tried the Make1Meg.TOS file and that does't work any ideas anyone Please?

Cheers

Mark

Apologies if I got this post late and it has already been replied to (as I suspect) but in case it has not:

There are IP addresses reserved for use outside of the internet. If you use these, you will not have any problems, and this is what I was meaning when i posted that. Perhaps I didn't make it very clear. Unfortunately, however, I have forgotten what these addresses are, although 10.x.x.x springs to mind. Maybe someone else can help.

You need HDDRIVER 6 and MagiC 5 or Big-DOS (included in the HDDRIVER)
distribution for this. HDDRIVER 6 has full support for DOS compatible
media with partitions > 32 MByte and is also capable of creating these
partitions on the Atari. It also comes with special support for ZIP and
JAZ drives concerning their unique features for read/write protection.
The demo version of HDDRIVER is avaiable from
acp5.chemie.uni-kl.de/pub/atari/hddriver61_demo.zip.

Oxo Concept give us a new browser BUT, what you must know is:
If you are working with a graphic card like Crazy Dots like me (and a lot of other people ...), you won'tbe able to see the pictures in the right way on your screen !!!!!! >>> Chaotic horizontal strips is all you'll see ... !!!
Like so much graphic french programs, the way to show pictures is never adapted to graphic cards.
E.G. D2M from Parx, Vision from Alias and now WebSpace from Oxo.

Though these three programs are very good in the whole concept they don't care about graphic cards on machines like MegaSTE and TT ... the developpers are only thinking in the of Falcon 030 ... indeed, no problems on a Falcon !

BE AWARE OF THAT !!!!

CAB is the only perfect compatible browser for each atari machine in all configurations !!!!!

Due to moving house I need to dispose of the following (and raise some cash!). All software is complete with manuals and boxed where applicable.

Imagecopy 4.0 CD
NVDI 2.5
Hisoft Basic 2.0
Apex Media
Studio Photo
True Paint
Extendos pro 2.0
Connect 2.46e
ICD Pro utilities 6.1.4
Whiteline Alpha CD
ScreenBlaster II (with hardware)
FreeKeys keyboard case
Abacus GEM Programmers Reference
Abacus ST Disk Drives Inside and Out
Abacus ST Machine Language
Abacus ST Tricks and Tips
Atari World 1-7 (magazine, no disks)
ST World 34,37,40,44-50 (magazine, in original binder)
ST Review 3,10-35 (magazine, no disks)
ST Applications 33-56 (magazine)

Sensible offers invited. P&P to be added or collect Gatwick/Crawley.

Graham Burst

Any joystick that works on a C-64 or Atari 2600 console will work on the
STFM. I seem to recall a vendor named "Maplin" but that could be
hallucinations...

Gaven, I dunno what you've seen, but except for the color, the TT keyboard
and the Mega STe keyboard I have are identical. I routinely use my old Mega
(non-STe) keyboard, though, because I like the feel better, and it fits in
my pull-out keyboard drawer.

I'd have to disagree on that, Bob. I had 2.05 for a couple of years before
I upgraded, and never had problems using 1.44mb floppies. I've actually had
more problems since the upgrade.

Eh? The Mac is compatible with the Mac, as Wintel machines are compatible with themselves! Apart from that, The Mac is compatible with Wintel machines if you want it to be, as well as being able to run Linux etc (yes, I know, it's years behind every other platform on that front).

For God's sake, don't bash the Mac just because an asshole like sinclap happens to be an advocate ;-)))

ATB, Frank.

Yep, this one local computer store that used to be an Atari
dealership. Now they sell nothing but PC stuff...but still they have
two ST computers used for inventory and recept printing. Even after
being screwed over by Atari, they still find ST's useful :)

Other ST sightings...I seen two of them in the old TV show Friday The
13th, and in the background of the first EPMD ablum. They took the
picture in their studio and had an ST and some other computer.

>these, you will not have any problems [...]

I believe addresses like 192.168.0.1, 192.168.0.2 and upper are just
reserved for this purpose, but I don't know if it's a class C or B, that's
if 256 or 65536 addresses are reserved... I use only these 2 for my Falcon
and STe network, if you have a more than 256 computers network, verify the
addresses in the relevant RFC!

Such addresses are reserved for local area networks, and if the LAN is
connected to the Internet, and by error a paquet goes out with such an
address, it will not do any harm as it will not be routed...

Bye! Bruno.

CPU level compatibility was promised. It was touted as one of the many
advantages of RISC technology. It never materialized and is now getting
swept under the rug.

Nevermind that Mac PC cards will most certainly cost you more than
an entire new PC.

Quite frankly, you aren't qualified to make that comment.
You don't even have any decent level user experience that
isn't greatly outdated. Furthermore, you've demonstrated
a complete computer illiteracy when it comes to technical
details of any kind.

Fill in the details, if you can.
Things that can be accomplished through applications
(like cyberstudio) don't count.

Furthermore, such 'distinctions' serve no purpose other than
'genetalia' waving.

It need not be modern. It needs to only do what is required
of it and not place uneccesary barriers to that end.

Most of the features that are new and nifty these days are actually
rather old. Most new microcomputer OS features are typically merely
repeating what has been done on the larger systems in the previous
DECADES.

>waste my time?
>
>An 060 may be too slow for MacOS, hell, a PPC is too slow for MacOS,
> but for TOS and Atari apps it is plenty fast.

Modern microcomputer OSes have a nasty tendency of 'getting in the way'
in that they eat up a large chunk of the machine they are running on.

The genius of TOS/GEM was that it delivered quite a bit while not bogging the machine down. It is appropriate for a 68000/8. System 6.0 was not and it showed. In a similar fashion, OSes have continued to grow faster than the hardware.

Until the recent drop in RAM prices, most 'modern' microcomputer OSes were painful to use as they would not fit inside the machines they were designed to run on. Innapropriate tactics, designed for highly concurrent, mult-user, high IO bandwidth machines were used. This virtual memory would slow down a Mac or PC to the point where an ST and it's 'primitive' OS could catch up.

ROM was faster than floppy in 1986.
ROM is faster than HD now.

Only a recent memory glut has saved the current crop of 'modern' machines and their OSes from running at the speed of a hard disk (50 times slower than a 68000/8) rather than their full potential.

Try to use one of these modern OSes in twice the memory capacity of an ST and see what happens. Then run the austere yet relatively perky ST next to that 'modern' machine.

Wow, if it happens to all the GEM programs you run then it sounds like it is a serious problem. Are you a running any screen accelerators like Warp Nine? I once installed Quick ST on my Stalker setup and after a while, I had a hard time getting the menu to work and it froze up. Took me less than a half a minute to ditch that! :)

If it is GEM itself, then you may have a problem with your TOS chip or the installation of it.

> Any suggestions?

I have no idea what graphics cards are selling for these days - but you CAN run CAB in low-rez and get 16 colors. Granted, it's not VGA-standard (640x480x16 or more colors) but it's better than mediumor high rez if you want to see waht all the fuss is about. The trick:

(1) Run in medium or high resolution and pull down the Options menu; click on Display and note which letter sets "Colour" on (it's "R" on CAB 1.5). Make sure you're set for a fixed width (might as well go for 640 pixels, or 800 if you prefer) and save the options.

(2) exit CAB, swithc to low res, and run CAB again. Pull down the same menu, and click Display again. Hit "R" (or whichever letter it is if someohow yours is different), then "Enter". Save the options again.

(3) Exit CAB and start it again (still in low-rez). Now you have glorious 16-color graphics and a window on a virtual screen with the actual Web page.

Incidentally, this is a quick-and-dirty method of viewing JPGs and GIFs in full color on the unmodified ST/STe - and using AltaLista, you can even make them fit in your visible window - just edit the list it produces to adjust the picture size until it looks right to you.

>"bug."

I've been hearing in mainstream news(by golly, this must 'be' important)
that when 2000 comes, alot of PC's and other systems would be really
fouled up. Is there any major concern about this, is the system date
unable to even rollover from 99 to 00?

I might have a theory on this...when "they" designed computer systems
years ago, they figured that no one would be using them for more than 5
years. A bit shortsighted on the engineers part. But who would thought
that we would still be using the same design and architechture of a IBM PC
in today's computers even right up to 2000?

Oh well... :)

Not sure about the Mac, no. I suspect the problem with the PC may be traced
back to Bill Gates, eventually. Haven't had to opportunity to probe the
hardware yet.

An Atari is an easy machine to write a link virus for -- just 545 bytes
for the carrier. But, the standard infection marker, so the virus does
not infect the same file twice, is to put two NOP instructions at the
start of the file. I have at least one commercial program marked in this
way to avoid link virus infection. Take a look at the start of the
suspect file to see if it is infected with a hex editor. And then again,
maybe not.

>
>Does anyone use protext, and if so do you have, or know where I can get a
>printer driver for a hp deskjet? I have a driver for ist word, but it is
>not recognised by protext.
>
Yes I use Protext v4.3. I've recently finished writing a printer driver
for my Deskjet 600, implementing proportional spacing, choice of fonts,
portrait/landscape, and half-line-feed.
E-mail me if you want a copy. Very cheap!
BTW I did a driver for the proportionally-spaced font (think it's called
Century) in the Panasonic KX-P4455 too. Anyone want that one?

> swept under the rug.

CPU level compatability with the x86 was never promised by any member of
the main trio which worked on PowerPC (Apple, IBM, Motorola). Apple
promised some degree of 68K compatability through software emulation.

There were plenty of rumors for awhile about a IBM project, the PowerPC
615. It was to be a 2-in-1 CPU combining x86 and PowerPC. You cannot
call it a promise since IBM never announced it, denied most if not all of
the rumors and leaks about it, and finally announced (at least a year ago)
that the project had existed but was canned due to technical problems.

> Nevermind that Mac PC cards will most certainly cost you more than
> an entire new PC.

I agree that this is the case. However, from my perspective as an
engineer, I can easily see why. They will never sell nearly as many of
those boards as a single PC motherboard manufacturer will of its
motherboard design, so the board cost is higher (volume production really
cuts costs a lot). And the system ASIC they have on it to glue everything
together is produced in even less volume relative to ordinary PC chipsets,
since PC chipsets are typically sold to many motherboard companies.

If you are in the market for a PC card, you must basically decide whether
the bad pricing (equivalent to buying an entire PC with the same specs) is
worth the advantages (you can use the same keyboard, monitor, mouse, and
no desk space is taken up by a second machine).

As usual, you failed to think at all.

Your advocacy issues are not welcome outside the advocacy groups (probably
not real welcome there, either, but that's another story).

I tried asking you to contribute positively - we Atari users have more in
common with most Mac users than with Windows users; but you can't seem to
distiguish between your opinions and the laws of nature, so your posts
are little more than rants, with no factual basis. Get lost.

Ever seen BeOS? All sorts of modern features. Faster interface response than TOS, on the same machine. (I can crank up ten or so instances of a little 3D rendering demo, causing the CPU usage to peg at 100%, and BeOS will still maintain instantaneous response to mouse clicks and keyboard events for the foreground app.)

> Until the recent drop in RAM prices, most 'modern' microcomputer OSes

> and it's 'primitive' OS could catch up.

Uh, yeah. Whatever. VM doesn't cause a performance hit unless you use enough memory to force it to start swapping pages out to disk. In other words, it lets you use your computer for more things if you want to. This has nothing to do with whether an OS is designed to run a huge multi-user behemoth or your personal computer (indeed, if you want a large compute server to have decent performance, you must put enough RAM in it so that it doesn't have to swap often, or else users will complain that the machine is a slug).

> ROM was faster than floppy in 1986.
> ROM is faster than HD now.

So what's your point? That we should stay mired in the backwaters of computing just to be absolutely guaranteed that a disk swap operation will never happen?

I don't think you need to go to so much trouble, Steve. Just format the
floppies on the PC to the "shape" (360Kb or 720Kb) required by the ST and
they will be interchangeable.

Hi. I'm looking for a complete HD Driver package, and have some Atari
hard/software that I would be willing to trade. Packages that I have include:

neodesk 3,04
Diamond Back 2
First Graph
Mini Office Pro
Warp Nine 3.75

I also have apsectre GCR, complete, with system disks that I would like
to trade for an ICD Link

Cheers!

Message-ID: <AF00024D9668F74EF@gizzmo.demon.co.uk>
Source record: 130147

```
A few bits of software for sale:

Didot Professional CD (pro. DTP) 25UKP
Retouche Professional CD (pro. image processing/retouching) 25UKP
Lattice C 5.5 15UKP
Studio Photo 10UKP

NeoN 3D (Falcon & FPU) 90UKP
This is (IMO) the best modelling app. available for the Atari.
The software itself is in English, but the manual is German.

_OR_ you can have the lot for 100UKP. All prices are plus postage, because
some of these things are pretty heavy.

All the best,
Nial.

The mechanism of this printer is a TEC mechanism, very usual in old lasers,
many brans of printers used the same toner (Toshiba PageLaser 6, Olivetti,
Inves, Manesman, etc..) Try with one of these.

Sorry, but look at the last TRM file from the M&E package, it have been done
for working with most of the graphical cards of the market, and if yours is
not inside, you can easily make your own driver with it !

To get more details : http://www.parx.fr/

>offer an alternate solution?

No need to use RAWRITE. Just format the disks on the PC to 720k (the DOS
command is FORMAT a: /F:720) and unzip the archives. The ST uses the same
format as MS-DOS (but TOS version prior to 1.04 don't write a couple of
MS-DOS-critical bytes in the boot secotr, so it's best to elt the PC do the
formatting).

Failry common, really (on my TT also). Keep track of which programs you run BEFORE running Everest (it happens with 7-Up, also; I can't use Tempus at all on my TT, however, it completely blows away the vidoe sync). One of them is messing with your MALLOC.

Unfortunately the early versions of Magic 4 did not work with IDE
drives, I'm not sure if this is the problem that you experience
though as crashing half way through seems a bit weird.

>Toad has offered to refund my money or replace the program, so it's not a total
>loss, but I'd still like to try MagiC. I emailed System Solutions and got NO
>response (thanks guys, that's what I call support! - NOT).

In defence of System Solutions they didn't sell it to you, they have
been on holiday until very recently, the bloke who handles teh email
was/is very ill so be patient!

>What's the problem here? Bad disk?

Sounds quite probable, if you can then go onto IRC and use an ircnet
server and go to the #atari channel, someone there will almost
certainly confirm if this is the IDE drive problem or not. I
appologise if this article has been responded to already but my ISP'
newsservers are incredibly lagged :-(

It was brought out as as a new format called 'PING' to ostensibly avoid copyright problems with the GIF format. Thus far it hasn't shown a lot of popularity although a load module is available for GemView.

Ron,

You've just graduated to the "I want to learn more" group. <G>

You can add downloadable files easily by inserting the proper HTML tags in
your home page, using any convenient text editor (7-Up is freeware, whcih is
VERY convenient).

The following tag would start a download of the file "pc_st.zip" if it were
located in the same place as your home page:

<A HREF="pc_st.zip">Download pc_st.zip</A>

(that may look funny on some newsreaders; it's NOT a real link, folx!)

Keep in mind that Unix (the OS used by most ISPs) is case-sensitive, so
PC_ST.ZIP is a different file than pc_st.zip!

If your Mac can read MS-DOS formatted disks, it can read the twister format.
However, it may hang on the Atari boot sector, which is formatted w/o two
bytes that Messy-DOS considers "critical." Get pc_st.zip from my ftp site
to fix that (you need an ST or a PC, sorry, there's no Mac version there).

Nothing in the computer market is sustainable. Change is the norm.

## 782. Messed up GEM text-display

Newsgroup: comp.sys.atari.st
Date: 1997-01-13 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d9a94a2a0037@sn.no>
Source record: 130197

Has anyone here experienced the text window of an editor being messed up sometimes?
This sometimes happens to me, especially after running a lot of graphical programs (viewers, icon editors, painting programs etc.).

What happens is this:

I start up one of my ASCII editors (mostly "Everest 3.5e", though the problems seems to happen with just about any editor when it occurs), if I start to write a new file my text starts *above* the first line- that is, the top half of the text vanishes above the GEM window and naturally gets cut in half!
The text often gets messed up as well, like bits of text being broken (like a corrupted graphic file looks like).

What happens if I load a text file is that I also see gray lines in between the text- the same colour as on the GEM desktop (hires mode). It's in between the text at certain places- it almost seems like it's generated where there are paragraph endings and/or tabs.

Anyway, the whole thing is pretty irritating, and the only solution is to reboot the machine, so obviously something in GEM becomes messed up now and then.

My system: STe/4Mb RAM/TOS 2.06/mono-hires display

: >2.1 gig HD 250
: >big HD case 40
: >--------------------
: > $900.
:
: What kind of Falcon system do you have? And do you have an IDE hard
: drive?

It's a stock 030 with four megs, but I think it's a later model, as it came with TOS 4.04 and the 85 meg Conner IDE, rather than a 65 which marked an earlier one. I was my usual insomniacal self, just chugging along the newsgroups in TIN, and I saw the "FS: Falcon" post. I jumped on it, and sadly even saw one person post a "WTB: Falcon" because I offered first. Wherever you are now, sorry about that...

: I've had an Atari 520ST for over 10 years and I was thinking of
: getting a better one to play around with music. (My main computer has
: been a PC since 1989). I called Toad Computers and the cheapest
: machine they had was a C-Lab Falcon mkII with 4 MB of RAM and a 520 MB
: hard drive and they wanted $1299 for it!

Might not be so bad-- maybe you could get one with the minimum config like 1 meg RAM and no hard drive and order one later, or use you existing external drive as the boot.

Of course, I didn't tell the whole story of my buying spree. I then decided to get a JAMin/JAMout 8/8 and Cubase Audio, from Computer Direct and Toad, respectively. Then HDDriver from C. Direct, then a nice mixer...

So I put about another $2,000 into it and music stuff <ouch! still paying on it :(( > But I love the Falcon. I've seen demos that blew my mind and heard phenomenal sounds. I'm still trying to figure out Cubase fully, and I have a 95 PC right next to it with a few sound editors. Now if I could just build that damn PARCP cable... might be easier just to get a Bi-parallel port card for $40. Cheaper in terms of my time, anyway.

Where's that ethernet card already?

BUT! The future of TOS HD recording might not only be with the Falcon! You might have seen postings or websites concerning StarTrack, a German product for the TT line of STs. Go to Computer Direct's site to check it out. I've not used the card or the software, but it doesn't appear that it has aimultaneous MIDI sequencing/playback like CAF. It's still exciting to me, though, especially when you can see the card... 12 tracks at 44.1 kHz.

P.S. Computer Direct also has PC Pentium cards planned for the TT line, so this also might affect your uprgrade decisions, though the key word here is "planned."

These are not the only Atari dealers out there, and I tried to spread my orders around as much as I could to be egalitarian about the whole affair. So my advice is try to determine exactly what you want, and do HEAVY research so you know the capabilities of the machine you're getting into and the s/w available for it. The net was invaluable in this, as was DejaNews to research old postings of c.s.a.st, and a lot of webbing. Next find the dealers who carry what you want, and try to get at least one quote. Then practice much patience and make good friends with your UPS guy.

Feel free to post or write e-mail for more info.

: Regards,
: Jamie

Hi Richard,
If I remember correctly, the most common problem when the light doesn't shut off is a heat-thread that's burned off.
Check them out. If you can't find spares, I know that the 804 is identical with a model from a company named TEC. I believe their model number is something similar (something with 804 in it).

Good luck and best regards,

Claes

: I started with MagiC3 and recently updated to MagiC5 and both types
: work/ed fine for me, although I have heard or read that the earliest
: releases of MagiC4 still were a little buggy.

1. You should not use any version below 4.01. Version 4.00 is too buggy.
4.02 is better.
2. You should better use 5.02 or higher.
3. Clear your AUTO folder and ACC folder first.
4. Use HDDRIVER, if available. This is the disk driver program we had
very little problems with.
5. The installation itself should alway run. During installation only
the ROM TOS runs. If you have problems during installation, your
hardware is broken, or the installation floppy disks are bad.

?!? Do you know people in Hong Kong, or did you go for a holiday? I got dragged
over (to visit relatives).

>I didn't notice any STs there though :-(
>Were they STs as we see them, or did you happen to see the business card
>machines having STs inside of them?

There was an article in ST Format 26 which featured it. The ST is hidden inside,
and I've seen one of these card machines opened up (at my local post office, for
servicing no doubt) and it has an ST in its full glory, complete in its casing!
You can still tell its an ST by looking closely at the edge of the machine's
glass "screen". There is the tell-tale sign of Atari grey in the edges...
i.e. a complete unadulterated Atari SM-series monitor inside!

For anyone who doesn't know, these machines are blue and look a similar shape to
fruit machines. The first thing to look for is the familiar ST-high resolution
display. You can work it out quite easily.

>I tried to notice as much as I could while being there, but since I've
>never used a MegaSTE or a TT it was kind of hard. What I especially noticed

No, the MEGA STE also has the LAN port. Interestingly (or not, actually <g>)
while at one of my cousins' in Hong Kong, I played on their PC Engine and noticed
the type of plug on the joypad leads: Hey, that would plug into my MEGA STE's LAN port!
(Probably wouldn't do it any good though)

>>>Anyway, there were several of them in that office, and I could tell they

When I went round to visit Manchester (university applications), they had a
room full of STs which students were taught on - obviously they recognise a
good platform when they see it! (unlike PSD). Unfortunately I have been
reliable informed that the PC invasion has ousted them :(

I bought EasyText Vector for the same reason, but I haven't given it a thorough test yet. The first thing that struck me is that it only allows a maximum of twenty fonts. This means that you need a separate NVDI setup for using EasyText Vector (unless you only have twenty fonts) and struck me as a bit limiting if you use high quality fonts which have use a separate font for bold, italic etc. - you have to plan which fonts you are going to have in your document before you even boot your machine :-(. It also takes a bit of configuring to get true WYSIWYG, but the docs are pretty good on this. Screen redraws are slower than Calamus on my Mega, but it is usable. As with most other DTP proggies you really need to prepare your text in an editor and import it - in-place editing is not very user-friendly.

In terms of value for money (20ukp) from floppyshop, I think EasyText Vector is very good, but if you can afford it I would imagine Papyrus 4 is better for document preparation. If you are doing the odd poster I would suggest EasyText Vector fits the bill.

Regards,

Michael

You have to make a simple adapter for the ROM-port. There are drivers in the current MiNTnet-distribution, and perhaps instructions on how to make the adapter too.

Browse the usual ftp-sites (ftp.fu-berlin.de is good for MiNT-stuff.) and look for a package called something like tuw-tcp.lzh. It contains all the necessary instructions for this adapter, as well as drivers for TOS.

## 800. Programming ideas

Newsgroup: comp.sys.atari.st
Date: 1997-01-13 00:00:00 UTC
From: tom.derrick@acpu.com
Message-ID: <853167230@acpu.com>
Source record: 130215

It seems to me that one or more people have volunteered to do some programming, and asked for ideas. I have been accumulating some; here they are:
1) I am an electrician; and in this state (Idaho), we are required to 'go to school' periodically. To make this more interesting, one of our instructors teaches a class in 'Programmable Logic Controllers' (PLCs). These are programmable logic black boxes (usually with 68000s, btw!) used for motor control and the like. During this class I found that someone had done DOS software to program these controllers, via a RS232 port. It didn't look too complex; maybe someone would like to try doing such a thing for the ST. Of course, the market would be miniscule at best. Maybe a DOS emulator (SoftPC) would be a better bet, if the PC serial port emulation is workable.
2) I have an Uninterruptible Power Supply under my desk these days for no very good reason. It has a 232 port on the back. Its dox have extensive explanation of what this is used for; perhaps an accessory that monitored this port and flagged you when something happens inside would be cool. Us TT and Mega STe owners have spare ports for this purpose; I don't really have any idea whether the ST and Falcon owners could benefit without a hardware add-on. Once again, a pretty miniscule market, but a little bigger than my first idea.
3) I use STeno as an accessory, and send text to STalker without saving it to disk. I would sure like to have the same facility with PageSTream - an accessory (it wouldn't have to be STeno) text editor to which I could type in text, and send blocks directly to PageSTream. After all, Cardfile can 'send' things to PageSTream; why not a text editor?
Anybody have any interest? If not, maybe I'll have to learn to program and do them myself, said the little red hen :)

Hi,

I just got my Falcon 030 a few weeks ago. Well, yesterday as I was toying with Logic Audio the following thing happened: I exited Logic Audio and wanted to check from the desktop menu how much I had HD space left. It didn't show anyting. And after this the machine only boots from the floppy drive!

Before this "accident" my Falcon used to show a big red ICD logo and some info while booting from the hard disk. I wonder if my hard disks boot sector has gone wrong? How should I fix this?

BTW, If I run Ahdi from one of the disks that came with my Falcon it shows my HD Conner 84MB as ID 0 0 (it also says "not Bootloaded" - whatever that means). But if I try the install device option from the desktop menu after loading Ahdi I get the C-icon but when I doubleclick it, not even a window appears on the screen.

Any help appreciated!

Greetings, Jouni Alkio, Helsinki, Finland

^^^^^^^^^^^^^^

This means the AHDI driver was not found on the hard drive.

You may need to run some disk diagnostic tools first.

Apple isn't alone in announcing vaporware. In fact, I can't think of ANY PC
or software hosue that hasn't done it at least once.

> Nevermind that Mac PC cards will most certainly cost you more than
> an entire new PC.

True, however... You won't need a second keyboard, second monitor, printer
switchbox, and so on. OTOH, plan on at least tripling the size of the hard
drive; MickeySlop is even more inefficient than Mac System.

No, I'm running it on my PowerMac 7500 (upgraded to 155 MHz 604). TOS run
through the services of a MagiCMac demo. BeOS DR8.2 for PowerMac.

> If you are refering to a Be Box,

On a BeBox, of course, the BeOS would try to balance the load between each
CPU. DR9 of BeOS will support multiprocessing on the Mac, but I don't
plan on getting a multiprocessor card any time soon.

>> Uh, yeah. Whatever. VM doesn't cause a performance hit unless you use

>O/S is always watching:).

No, it's because the MacOS has one of the crappiest VM implementations in
the known universe.

Still, if you are careful to keep the memory consumption of all your
programs beneath the size of total physical RAM in your machine, you
should not ever see a bad VM hit.

>> > ROM was faster than floppy in 1986.

>
>How can you consider ROM based operating systems to be " mired in the
>backwaters
>of computing"?

Take the phrase to mean "stuck with an OS that doesn't support VM". As far as I'm concerned, an OS without VM and memory protection is fairly backwards (which is one of the two big problems with the current MacOS). Every personal computer CPU from the 68030 and 386 onward has had the hardware to support it.

> You sound smarter than that. Almost all embedded systems
>used in
>industry utilize a ROM based operating systems. It is more efficient.
>When was
>the last time you had to boot your 5 axis CNC mill from floppy or hard
>disk?

Embedded systems are an entirely different thing. (I've designed and built an embedded computer based on the 68HC11 microcontroller, so I do know whereof I speak.) Your typical 5 axis CNC mill is not an ideal environment for magnetic media. Reliability is more important than the ability to change programs on a whim. Programs tend to be small, and operating systems (if they exist at all) do not usually need to offer services like VM. So it's entirely practical to put most things in ROM, and use some form of solid-state memory for dynamic storage (like flash memory).

>unable to even rollover from 99 to 00?

The problem is, from what I understand, is if a computer sees a date as entered as 97, it interprets that as 1997. If it sees 54, it intreprets as 1954. 00 is 1900. What will happen in the year 2000? The system will see it as 1900 because its designed to interpret the date as one from the 20th century (19xx). In the year 2000 and after, programs will be messed up due to the date. Current programs can be altered to show a 21st century date, but will they be intelligent enough to differentiate with dates that refer to the 1990's, for instance? And what about programs no longer being supported (on any platform); who will correct those? It's a puzzle....

-Dana

## 810. ST Megademos/Games

Newsgroup: comp.sys.atari.st
Date: 1997-01-14 00:00:00 UTC

Message-ID: <01bc0266$cc90e960$0720a5ce@Primenet.Primenet.com>
Source record: 130026

I'm starting to collect PC and ST megademos.I'm having a hard time finding a good site for ST ones,does anyone know of any??? Does anyone have the Metallica Master of Puppets demo for the ST? And,on a different note,has anyone at all out there played,heard of,or seen the game Arnorath by Top Byte Software for the Atari ST that came out in 1996 (reportedly) ? Or Sheer Agony,the graphics adventure for the ST that also came out in 1996? I want to collect all the last/latest games/demos for the ST.I think those will be colectors items.What was the last big demo made on the ST,anyone know? Do they still make them in Europe anywhere? I know in Poland a few 8-bit games even came out recently.And is the July '96 issue the last one ST Format put out?-Satcom2

OIC. Perhaps NZ has offended the great Tramiel family and therefore were
banned from having the real MSTE keyboards?

The C-lab Falcons, and Mega STEs (that a couple of people in the local
user group now have) all came with the _original_ Mega keyboard. Blecchh!
(At least they're better for typing than the ST/Falcon keyboard)

Here are a couple of tidbits of history that may clear a few things up. Btw, NO, I'm not ancient, I'm only 28... I just like the history of computing.

* What's an Extra 2 Bytes, Anyways?*
In the early days, when signs of the first micro-computers were hitting the streets, the mentality was that RAM was precious. (Actually, ALL computer hardware was considered precious!) Why? Well, at that time, mainfrrames still ruled the land and minis were also extremely popular. Not all companies wanted to spend the hundreds of thousands or even a million dollars or more to buy these huge systems so they leased them from companies like IBM and DEC. Well, IBM and DEC would charge these companies extreme amounts of money per month, particularly the RAM! We're talking something like $1200.00 a month per meg of RAM. Since this was the case, companies wanted their programmers to exclude everything and anything that wasn't absolutely necessary, thus saving valuable memory. As time went on and systems became standardized in a lot of ways, like PC's for instance, so did software. I could go on, but I think you get the picture.

* Is a 99 to 00 Date Rollover Really That Aweful? *
YES! I'll just sum up ONE example for you... Pretend that Ma Bell had never updated their software to include those extra 2 date digits into their accounting software. Now, on your next phone bill, you're expecting the usual charges plus a few long distance charges, etc., but instead your bill is about $23,000, not the expected $48 or so. How could this happen? Since that billing date will be, say, December 19th, 1999, but Ma Bell's system holds the date as 12/19/99 and the accounting software only processes that billing period on first of the following month... 01/01/00. The software will see that you haven't paid for all the months starting from 01/01/00 all the way up to 12/19/99. We're talking 1200 months! Get it?

Brad.

This is a very good point. One that I wish the frequent Mac advocates
here would consider before bashing the cost of a Direct T060. The
limited
production of these machines is the driving force of the "touted" high
price tag. Even then, "major apps" aside, the Direct T060 (Hades) is
at a performance advantage over even the fastest of Mac's because of
the TOS operating system utilized. For most users of the 060 clones,
this is the driving factor behind their purchase, major apps aside.
The Atari user that requires features such as built in ethernet has
probably already purchased a Mac as it has been a standard feature
for quite a few years. For the home Atari user, the ability to
utilize a DTE rate of 230kb has been available for quite a few
years. The talk of Apple adopting a major alternate O/S has been
going around for quite some time. Maybe it will happen. There are
several alternate O/S's for TOS based users to choose from. Many
already have supporting applications that are readily available for
download, generally freeware or at a modest price. No need to see
what the Be O/S might offer the PPC user. One thing is for sure,
you probably won't be upgrading a Claris or Adobe product for
a Be O/S replacement app. Most TOS apps function equally well
under any of the available O/S's, something TOS users have under
stood for quite some time. The T060 is a new beginning for the TOS
platform. The expensive proprosition of upgrading a Falcon to a
040 CPU becomes an inviting alternative when what you stated above
is taken into consideration concerning limited production and pricing.
"

Opps.... I rambling again.....

Yep, but for now all you have are demos. You don't mention what machine
your
are running the Be O/S on. Same machine? Are you saying that there is a
port
of the Be O/S for TOS based machines? If you are refering to a Be Box,
then
why wouldn't the second CPU be available while the other is pegged at
"100%".
I would hope that this is what the machine was designed for. My god,
could you
image a dual processor T060 running two copies of MagiC at the same time
in
two different windows on the same 21" screen. It boggles the mind.

>
> Uh, yeah. Whatever. VM doesn't cause a performance hit unless you use

How can you consider ROM based operating systems to be " mired in the backwaters
of computing"? You sound smarter than that. Almost all embedded systems used in
industry utilize a ROM based operating systems. It is more efficient. When was
the last time you had to boot your 5 axis CNC mill from floppy or hard disk?

Very unlikely..

Your best bet is to format a PC disk on the mac, copy the Atari files
to it and re-read on the mac.

Steve.

Bwagh haa haa haa. Peter, you really are a dork. You are comparing TOS 1.0 from 9 years ago to the likes of TOS 4.04, MagiC 5 and Geneva which are operating systems used on Ataris today. Why, going on that i can say that MACOS doesn't have any colour at all and still uses small 12 inch screens... why, I might even go as far as saying that PCs use something called MS-DOS 3.xx and no window environment.. hey... I can even say that Unix doesn't have a woindowed environment!

GET REAL Peter!!!

> "bug."

Actually, the TOS system clock is stored internally as a 32-bit word,
which counts the number of seconds since November 7, 1985. Macs &
Pee-Cees have a similar mechanism, but earlier "start" dates. That's
enough resolution to last about 136 years. I imagine TOS will be
pretty much obsolete before its date format becomes a problem..

The "Year 2000" problem stems from software (mostly old mainfraime
database software) that was poorly implemented, and only stored the
last two digits of the year. It doesn't really have anything to do
with current operating systems, only old databases.

If anyone here thinks that the Mac will have a problem with 2000AD, then
they're in for a surprise. Every Mac made will have no problems with it.

Funnily enough the one time I played with Logic Audio I ended up with a
directory written in the middle of the (scsi) FAT (or some similar
corruption).

I was using the ICD driver's - in future if running Logic Audio I shall
make sure write caching is off... possibly read caching too.
I might also run it on an empty cartridge until I am confident it won't
do something similar again.

Actually I believe Logic Audio is only available over the net and was
withdrawn from sale... perhaps this is the reason.

I would have to disagree. The driving factor is that people who buy one
must really have an attachment to legacy Atari software that needs to run
as fast as possible. Sure, TOS responds (relatively) quickly, but the OS
only does so much. When it comes down to how fast your computer does
compute-intensive tasks, a PowerPC is going to blow away the 060.

>The talk of Apple adopting a major alternate O/S has been
>going around for quite some time. Maybe it will happen.

Haven't you heard? Apple bought out NeXT. The NeXT generation Mac OS
will be NeXTStep. (Sorry, couldn't resist the obvious pun.) They plan to
keep releasing System 7.x updates for a couple years, but the new OS based
on NeXTStep will be the flagship OS. Apparently they plan to release the
first version in about 1 year, which is actually realistic since it's a
complete OS already and they've got the entire NeXT development team.

I ment that stupid DOS/Windoze compatibilty we've been forced fed during
the last couple of years. It's in every store I walk into, and hardly
much stuff for Macintoshes...so you can imagine what's it like someone
only having a little ST. :)

Sure would be nice to be able to walk in any computer store and get the
stuff like modems you need without having to ordering over the mail. With
a machine like DirecT/40, you probably can :)

>For God's sake, don't bash the Mac just because an a**hole like sinclap
>happens to be an advocate ;-)))

Naw...I don't bash the Mac cause of one person who's stupid even with no
computer at all. Heck, I really like PowerMacs which are the only Apples
that don't crash...and I used them all :)

But it's really stupid to say "my computer's better than any of yours"
when looking at the real world. I suppose those kinds of people never
understood the phrase, "Who gives a crap!"

I have to disagree with you here, only because we sell the machine
and have sold it as well DTP software to major pre-press houses.

The T60 with Calamus SL or DA's Layout outperforms any PPC or Pentium
in it's price range.

You would really have to experience it to understand it. Words cannot
describe the performance levels attainable.

>Haven't you heard? Apple bought out NeXT. The NeXT generation Mac OS

This is probably the best news for Mac owners, but it is much further
than 1 year away... Sometime in 1998 is the ETA and as we all know from
experience, this may likely be delayed. By then I believe MS WinNT will
have made such a dent into the pre-press market that NexT/Mac OS may
be too late.

I sincerly hope that this does not happen though.

All the best,
Chris @ Computer Direct

## 841. Is there a FAQ for this newsgroup?

Brant Sears <bsears@physix.com> said:-

>I am looking for information regarding the Atari Portfolio. Thanks.

Here are a few informations about this nice little machine, I have
one.
* MODIFICATIONS (everything possible) :
- memory expansion
- car adaptator
- EPROM cards
- ROM/RAM cards
- PCMCIA adapter
- serial/paralel interfaces
- ...
Stefan_Kaechele@FR.maus.de

also
*THE PORTFOLIO CLUB is proposing a MIDI 2ins/2outs interface:
Musik & Daten
Gorlitzer Str. 21a
D-90579 Langenzenn
tel: 09101 91 41

I also know that there is a Portfolio Club in England;
*"ANY PORT IN A STORM"
Kevin Swaine
Ivy Avenue 90
BATH BA2 1AN
U.K.
Kevin has a lot of softwares for the computer ...

If you want any information about the machine itself, then ask me ...
I will try to answer ... I'm using the Portfolio to write articles
when I'm not home, then I can transfer them with the serial interface
and the atari program "ST Transfer". I'm also using Portfolio for the
spreadsheet utility Lotus compatible ... it's enough for me, I use
also a lot the addresses book.

>had a hard time getting the menu to work and it froze up. Took me less
>than a half a minute to ditch that! :)

Nope, no accelerator. I did try "Quick ST" a few years back, but it caused
so many problems with other programs that I got rid of it.

>If it is GEM itself, then you may have a problem with your TOS chip or the
>installation of it.

Hmmmmm... no, I don't think so because everything else works fine.
Perhaps it's because of some older programs. Yesterday when this happened I
had just been using "Iconjuggler" and "Iconman" a lot, working on many
different .RSC files and switching between the two programs- going back and
forth on the desktop (I don't have multitasking).
I noticed that the same problem occured after having run "Hyperpaint", but
I haven't used that program for a while now...

Anyway, I did get a "fixer" that came with the "Gemview" package, called
"vdi_fix.prg", but it refused to install itself on my machine- I got some
message saying that my version of TOS didn't need it or something.
I don't even know if this has anything at all to do with my occasional
screen "messup".

Source record: 130096

Having just got my Falcon back from Tritan Designs with my lovely new Nemesis board fitted - god, it's bloody great isn't it, 640x480truecolour, what the Falcon should have been all along :)

I thought I'd see how many other Nemesis owners are out there?

If you are the proud owner of a Nemesis board, either post the fact here, or email me. I just thought it might be nice to be able to bounce ideas, problems etc. off of one another :) Not that I've noticed many problems with it. It's totally amazing and given my Falcon a new lease of life.

Thanks to all at Titan Designs/Black Scorpion Software for a small miracle :)

If you haven't yet reached that point then you aren't really using
the virtual memory now, ARE YOU? You could just as easily turn the
toy off. However, if you were to actually actively use any non-trivial
amount of VM, Mac's and PC's are crippled.

Virtual memory was developed in one context and then applied to another.
This is a simple matter of computing history and architecture for those
who know and understand the issues involved.

>words, it lets you use your computer for more things if you want to. This

>behemoth or your personal computer (indeed, if you want a large compute

Actually, it does. The disk and the bus it is attached to has to
be up to the challenge. Otherwise, your machine takes a HUGE performance
hit should it ever decide to use that nifty virtual memory. This is
quite easy to demonstrate with a microcomputer.

>server to have decent performance, you must put enough RAM in it so that

>
>So what's your point? That we should stay mired in the backwaters of
>computing just to be absolutely guaranteed that a disk swap operation will
>never happen?

So? How is TOS a backwater? One has yet to address that. All you
MacVocates can come up with are application level toys.

However, since Petey-Boy himself seems to think that the OS is just
a pathway to the apps, then great OS sophistication really isn't
required. There is little that MacOS or Win95 has that cannot be
grafted upon TOS at the applications level. Most of what they have
are bells and whistles.

Software should be designed to run on the hardware of today, no 4
years in the future. While petty justifications for braggadocio are
nice and all, computers are tools in the end. They either do the task
you desire in a satisfactory fashion, or they do not. Beyond childish
rhetoric, you have said nothing. How does TOS limit the user? Which
of these limits is not addressed by MagiC 4.0?

## 852. STiK/CAB error message new to me

Newsgroup: comp.sys.atari.st
Date: 1997-01-14 00:00:00 UTC
From: Doug Kendall <dkendall@facstaff.wisc.edu>
Message-ID: <32DBB4C0.4C4C@facstaff.wisc.edu>
Source record: 130104

Last evening while running CAB 1.5 on a STiK connection, I received the following error message repeatedly while connecting to the WebCrawler (http://webcrawler.com) search engine: "STiK-KRfree()/Memory corruption detected". The message appeared every time my modem made a connection to WebCrawler's server, but could be cleared with no apparent effect on transmission. When I moved on to other sites, I no longer got these messages.

The session was otherwise unremarkable. I have accessed WebCrawler many times previously without incident and have never gotten this message at any time before.

I had downloaded a lot of email via AntMail 0.7.9 prior to running CAB and the only unusual thing that had happened there was that I lost the SLIP connection while editing a message and had to reconnect. This had no apparent effect on the email session.

I am running a 2.5meg 520ST w/AT Speed emulator card, TOS 1.4, 2 floppies, EZ135 w/ADSCSI+ SCSI adapter, Supra 9600 baud modem, STiK 1.12, CAB 1.5, CAB.OVL 1.20h (I think), Antmail 0.7.9.

Anyone have suggestions as to what happened and whether I should be concerned?

What is the e-mail address of Best Electronics, the place people talk about for Atari Software/Hardware. Also a snail mail address and a phone number (toll free if they have one if not a regular one will do) would also be appreciated. Thanks...Btw, if there is someone specific person I should send e-mail to, then that person too.

Source record: 130107

Just about any of the newer hard disk driver programs for the atari TOS line of computers can handle the JAZ drive, at least if you don't insist on being able to write protect and encrytp the JAZ drive, in that case I think that HDDriver is the one you want. You don't need a special driver from the manufacturer, that's only the way Mac works, The Atari TOS driver software is smart enough to ask the the drive what kind it is and go from there! 8^)

Thus we can reasonably assume you consider the various kludges from Redmond
to be "backwards?" One of the iggest causes of GPFs (or whatever Win95
calls it now) has always been memory "protection" that didn't.

## 857. Wanted: best terminal program for freenet

Newsgroup: comp.sys.atari.st
Date: 1997-01-14 00:00:00 UTC
From: Mike Scholman <mikescholman@geocities.com>
Message-ID: <01bc01d7$29ac85e0$fc39d9a5@mikehome>
Source record: 130109

I've been looking for a while for a good PD/shareware terminal program that will do full VT100 or higher. I've tried a number of programs which do ANSI, rather that a true VT100, and display wierd codes, jumbling up the screen. I've fornd two programs which seem to work, each with it's own problems:

Teddy Term - great program, but it uses CTRL-key combinations for keyboard shortcuts. The freenet shell account uses PINE for email, which also needs the CTRL-key combinations.

MINIterm - also a pretty good program, but no auto-redial or integrated Zmodem

Programs which did not work because of incomplete VT emulation:
VanTerm 3.8
OpusTerm

## 858. Did you hear anyone say "Goodbye"?

```
Did you hear anyone say "Goodbye"?
==================================
by Donald A. Thomas, Jr. (10/4/96)

It's odd to imagine an institution, which was as big and as powerful as
Atari
once was, to have been shut down in recent days. The real amazement for
me is
that it was all accomplished without a measurable flinch from within or
outside
the gaming industry. I can understand that gamers wanted to push Pong
out the
door early in the timeline. I can appreciate that the classics such as
Missile
Command and Asteroids do not push 32-bit and 64-bit systems to any
technological
limits. I know all these things intellectually, but the heart cannot
face the
truth that the world and the corporate machine known as Atari could not
find an
amicable way to coexist.

On Tuesday, July 30, 1996, Atari Corporation took each and every share
of it's
company (ATC), wrapped them all in a tight bundle and presented them to
JTS
Corporation; a maker and distributor of hard disk drives. On Wednesday,
the
shares were traded under the symbol of JTS. Within a few weeks, the
remaining
staff of Atari that were not dismissed or did not resign, moved to JTS'
headquarters in San Jose, California. The three people were assigned to
different areas of the building and all that really remains of the Atari
namesake is a Santa Clara warehouse full of unsold Jaguar and Lynx
products.

It was only as long ago as mid '95 that Atari executives and staff
believed
things were finally taking a better turn. Wal*Mart had agreed to place
Jaguar
game systems in 400 of their Superstores across the country. Largely
based on
this promise of new hope and the opportunities that open when such deals
are
```

made, Atari invested heavily in the product and mechanisms required to serve the
Wal*Mart chain. But the philosophical beliefs of the Atari decision makers that
great products never need advertising or promotions, put the Wal*Mart deal
straight into a tailspin. With money tied up in the product on shelves as well
as the costs to distribute them to get there, not much was left to saturate any
marketplace with advertising. While parents rushed into stores to get their kids
Saturns or PlayStations, the few that picked up the Jaguar were chastised by
disappointed children on Christmas day.

In an effort to salvage the pending Wal*Mart situation, desperate attempts to
run infomercials across the country were activated. The programs were
professionally produced by experts in the infomercial industry and designed to
permit Atari to run slightly different offers in different markets. In spite of
the relatively low cost of running infomercials, the cost to produce them and
support them is very high. The results were disappointing. Of the few thousand
people who actually placed orders, many of them returned their purchases after
the Holidays. The kids wanted what they saw on TV during the day! They wanted
what their friends had! They wanted what the magazines were raving about!

In early 1996, Wal*Mart began returning all remaining inventory of Jaguar
products. After reversing an "advertising allowance" Atari was obligated to
accept, the net benefit Atari realized was an overflowing warehouse of inventory
in semi-crushed boxes and with firmly affixed price and security tags. Unable to
find a retailer willing to help distribute the numbers required to stay afloat,
Atari virtually discontinued operations and traded any remaining cash to JTS in
exchange for a graceful way to exit the industry's back door.

Now that JTS has "absorbed" Atari, it really doesn't know what to do with the
bulk of machines Atari hoped to sell. It's difficult to liquidate them.

Even at
liquidation prices, consumers expect a minimal level of support which
JTS has no
means to offer. The hundreds of calls they receive from consumers that
track
them down each week are answered to the best ability of one person.
Inquiries
with regard to licensing Atari classic favorites for other applications
such as
handheld games are handled by Mr. John Skruch who was with Atari for
over 13
years.

In spite of Nintendo's claim that their newest game system is the first
64-bit
game system on the market, Atari Corporation actually introduced the
first
64-bit system just before Christmas in 1993. Since Atari couldn't afford
to
launch the system nationwide, the system was introduced in the New York
and San
Francisco markets first. Beating the 32-bit systems to the punch
(Saturn/PlayStation), Atari enjoyed moderate success with the Jaguar
system and
managed to lure shallow promises from third-party companies to support
the
system. Unfortunately, programmers grossly underestimated the time
required to
develop 64-bit games. The jump from 8-bit and 16-bit was wider than
anticipated.
In addition, Atari was already spread thin monetarily, but were required
to
finance almost every title that was in development.

After the initial launch, it took Atari almost a year before an
assortment of
games began to hit store shelves. Even then, having missed the '94
Holiday
Season, many of the planned titles were de-accelerated to minimize
problems
caused by rushing things too fast. Consumers were not happy and
retailers were
equally dismayed. The few ads that Atari was able to place in magazines
were
often stating incorrect release dates because that information changed
almost
every day although magazines deadline their issues up to 120 days in
advance.

It was in 1983 that Warner Communications handed Jack Tramiel the reins
of

Atari. By this time, Atari was often categorized as a household name, but few households wanted to spend much money on new software and the systems were lasting forever. No one needed to buy new ones. That, combined with Warner's obscene spending, amounted to a *daily loss* of over $2 million. Atari was physically spread all over the Silicon Valley with personnel and equipment in literally 80 separate buildings; not considering international offices and manufacturing facilities. Mr. Tramiel took only the home consumer branch of Atari and forced Warner to deal with the arcade division separately. Within a few years, Jack took the company public, introduced an innovative new line of affordable 16-bit computers and released the 7800 video game system.

To accomplish these miracles for Atari, Jack implemented his "business is war" policies. While people who publicly quoted his statement often felt that policy meant being extremely aggressive in the marketplace, the meaning actually had closer ties to Tramiel's experience as a concentration camp survivor. Of the 80 buildings in Sunnyvale, Santa Clara and Milpitas, almost every one of them were amputated from Atari's body of liabilities. The people, the work, the heritage, the history were fired or liquidated. Those who survived were unsympathetically required to fill in the gaps and while most tried, few actually found a way to be successfully do what a dozen people before them did. Atop the mountain, Jack pressed with an iron thumb. All Fed/Ex mailings were required to be pre-approved by one of a handful of people. "Unsigned" purchase orders went unpaid regardless of the urgencies that inspired their creation. Employees found themselves spending valuable time trying to find ways around the system to accomplish their jobs. Many of them lost their jobs for bending the rules or never finding a way to make things work. As horrible as it all sounds, it actually was the only way

to protect Atari as a company and give it a chance to survive as it did and did
very well.

Jack's introduction of the 16-bit computer was initially hearty in the United
States but it went extremely well in Europe. Europeans were not accustomed to
"affordable" technology and although the Atari computers were not IBM
compatible, it didn't matter because people could afford them. Jacks' private
laugh was that the computers were sold at prices much higher in Europe than
Americans were willing to pay. As a result, most of the machines made were being
shipped to European destinations to capture the higher margin. This enraged the
people in the United States that had been Atari loyalists. While waiting months
for stores to take delivery domestically, international magazines were touting
ample supplies. Those in the know within the U.S. became dismayed. The remainder
never knew Atari was slowly abandoning the value of Atari's name recognition as
it became easier and easier to forget some assuming Atari had long filed for
bankruptcy.

On a technical level, Atari 16-bit computers were designed beyond their time.
For less than $1,000, consumers could enjoy "multimedia" before the phrase was
ever really widely used. The icon-based working environment proceeded Windows
popularity although the essential attributes of the two environments were very
similar. MIDI was built-in and became an instant hit in the high-end music
industry. Tasks were activated and manipulated with a mouse and the system
accepted industry standard peripherals such as printers, modems and diskettes.

With all the genius that went into the technology of the machines, very little
of equivalent genius went into the promoting and marketing the machines. Mr.
Tramiel was the founder of Commodore Business Machines. When he introduced the
PET computer in 1977, Jack discovered he didn't have to call a single

publication. Instead they all flocked to his door demanding an opportunity to see the product. News magazines. Science Journals. Business newsletters. Newspaper reporters. They were all there with microphone, camera and pen in hand. And they kept coming back. Adding a switch, announcing a new 4K application or signing a new retailer were all big stories the press wanted to handle.

Today, a new video game announcement may generate a request from any of the dozens of gaming magazines for a press release, but a lot of costly work has to be done to assure fair or better coverage. Editorial people are literally swamped with technical news. Samples are mailed regularly to their attention. Faxes fly in through the phone lines and e-mail jams up their hard drives. It takes a lot to grab their attention.

While Atari retained hopes to be successful with the Jaguar, Atari's marketing people were fighting established standards in the industry with severe handicaps. Since cartridges (the Jaguar was/is primarily a cartridge-based system) were so expensive, editorial people were required to return them before new ones would be sent. Editorial people like to assign review projects. So finding cartridges they sent out was not always easy to do. Additionally, reviewers often love their work because they get to keep what they write about. Regardless, the few magazines willing to cover Atari products were more often turned away because of a lack of programmable cartridges or any number of other indecisive barriers. In-store signs and posters were sometimes created, but many retail chains charge premiums to manufacturers that want to display them. Some direct mail campaigns were implemented, but Atari often could not afford to keep those things being advertised on schedule. Therefore, the advertisements were published and distributed, but the product was not available.

Clearly, Jack's experience with the world beating a path to the door of a

company making a better mousetrap no longer applied. The world had revolved a few times beneath him and he never noticed. The tactics used to successfully sell Commodore computers were simply antiquated notions from the past. Meanwhile, Sony launches the PlayStation with over $500 million in marketing funds. Today, the PlayStation is considered the most successful next-generation gaming machine throughout the world. Sony bought the market. Tramiel's Atari never learned how to do that. Actually, they never could afford it anyway.

After the 1990's got underway, Europe as well as the rest of the world, discovered that IBM-compatible computers were becoming more powerful and more affordable. The world always did want computers at home just like in the office and companies like Dell and Gateway exemplified the industry's trend toward home-based office computers. As a result, companies like Commodore, Atari and Next couldn't compete any longer. While the dedicated user base of each of them felt abandoned by these companies having to leave the computer market, the inevitable prevailed. Commodore jumped ship, Next changed business goals completely and Atari invested what they had left in the Jaguar game system. Even today, Apple is kicking and screaming. As good as Apple was at creating a huge niche for themselves, they focused more heavily on education. When kids grow up and get jobs, they want business machines. IBM was always the business standard.

When one examines the history of Atari, an appreciation can grow for how many businesses and people were a part of the game over the years. Chuck E. Cheese Pizza was started by Atari's founder, Mr. Nolan Bushnell. Apple Computer was born in a garage by ex-Atari employees. Activision was founded by Ace Atari programmers. The list goes on and on.

But for some pathetic reason Atari's final days came and went with no tribute, no fanfare and no dignified farewells. Why? Where did all the talent go? Where

are all the archives? Where are the vaults? Where are the unpublished games and
where are the originals of those that were? Why has no company stepped forward
to adopt the remaining attributes Atari has to offer? Where are the creditors?
What has happened to all the properties and sites? Where are the databases,
warranty cards, promotional items, notes on meetings, unanswered mail? Who owns
P.O. Box 61657? Who goes to work in Atari's old offices? Where do consumers have
their systems fixed? Who is publishing new games? Who still sells Atari
products? Why are there still a lot of people talking about Atari on-line?

I'm an ex-Atari employee and proud to have been. I'm still an Atari devotee and
proud to be. To me, these are questions which all deserve an answer, but who
will ask them?

The best people to ask these questions are those who have exposure to the
public. If you believe Atari left us without saying goodbye, contact Dateline at
dateline@nbc.com. If you REALLY believe, then send this article to 10 of your
friends in e-mail. AND if YOU REALLY, REALLY believe, mail a few to newspapers
or other news programs. A letter in your own words would be great!

I'd spend money for a thorough retrospect on Atari. Wouldn't you?

Wouldn't it at least be nice to say "Goodbye"?

>My system: STe/4Mb RAM/TOS 2.06/mono-hires display

I've had this happen too and could never figure out what was causing it. It used to happen every so often when I used SingleTOS as my main OS, though I've had it happen when experimenting with MiNT/AES 4.0 and 4.1 (this usually gave a message about a fatal error in the AES). Now I've switched to MagiC as my main OS and don't recall it happening since, but this could be because whatever program was causing the problem isn't used as much. Maybe Gemview, as I used to use the ST Review version quite a lot but now it's only used occasionally since buying Imagecopy.

I'm using an identical system but with TOS 1.62, MiNT 1.12 or MagiC 5.

Doubt if I've helped much, but you aren't the only one with the problem!

Accurate. But when I buy a PC card, it will be a Pentium card, not an
obsolete 486 like Orange Micro sells.

## 865. Re: TT: cutting trace under chip

Newsgroup: comp.sys.atari.st
Date: 1997-01-14 00:00:00 UTC
From: Jim DeClercq <jimd1@primenet.com>
Message-ID: <5bgktu$gho@nnrp1.news.primenet.com>
Source record: 130117

Thanks to all who replied by e-mail. Now I understand.

There is an easy way to remove chips, of any style, from a PC board, although one of the tools is a bit pricey. A soldering iron, solder wick braid, and liquid flux, to dip the braid in, and perhaps more solder, for through-hole chips, are used to remove as much of the solder as possible.

The expensive but easy part is done with a very small source of very hot air. I use a Weller Pyro Pen, which will melt solder with its hot air output, and move it smoothly over the area to be de-soldered. The solder will all melt at once, and the part will pop off or drop out, depending on whether it was surface mount or through hole, with absolutely no damage to the PC board.

## 866. Need help with "Address 2.04"

Newsgroup: comp.sys.atari.st
Date: 1997-01-14 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32dac268d97d2@sn.no>
Source record: 130167

I'm having problems trying to find out how to enter new addresses in the program "Address" (version 2.04). I've got the registered version along with the ST-guide online manual, but it's still pretty unclear.

The problem is that when I try to enter a new address I somehow keep editing an existing one- how do I just add a totally new address?

Actually, if you saw a GPF notice, then protection was working.
Now, if on the other hand, it just mysteriously crashed: that
would be a protection failure.

Although the (pragmatic) need to restart Win at that point is rather
contrary to the whole point of memory protection however...

Don,

Very well written article. I first got aboard the Atari wagon in 1976 or so with the VCS .. then sold it and in 1980 got the Atari 800, my first computer, which I used to get through some college 'basic' programming classes, even though we were using IBM's then .. I could write my programs in OSS Basic XL, then convert it "on the fly" in the classroom ... I was always the 1st one done with my programs .. got A's in both classes too. Over the years, I've had many Atari computer systems, even had an ICD Multi I/O system with 1meg MIO and a 40meg HD, along with the 320k 130xe and the xf-551 dual system (which had a 3.5" 720k floppy).

Now, I'm using a PC, like most people. I still have my original 800 set up at home, as well as a 130xe. Somehow, I can't bring myself to put them away. I suppose I will, one day.

You're right. It WOULD have been nice to say, "Goodbye"!

Bill

Easy. Get Edith (Editress) from ZFC's web site. This is one kicking editor, in english, works in 1280x960 (the largest I use), open as many files as you can have windows, the GEM interface for it isn't exactly GEM, but I use it with MagiC 5.03 with no other irritation other than the fact that the desktop icons are hidden, handles files as large as your free memory, is no longer commercial, but is freeware (you can only get it from his site though) In addition, there are too many features to believe. Easy to use too.

At least in the case of System 7, all it really depended on was you not running much extra crap. 4 MB is enough to run one or two programs at a time on a 68K Mac with System 7.1, without VM. 7.5 increased memory usage somewhat, but by the time it was released, memory was cheap enough that lots of people were going to 8 MB or more.

Hype? Nah. It's just an essential part of running a computer. If for no other reason than that implementing VM usually gives OS designers a straight path right into memory protection (or vice versa).

Surprise, surprise. If you really beat that VM system hard, it'll thrash and you lose all your performance. In my experience, there are usually ways to avoid it.

>
> I wouldn't be surprised if core memory were faster...

Neither would I, at least in terms of access time (core is random access). Interface speed may or may not give disks an edge in throughput; I have no idea how core is interfaced to.

I've never said that VM is a replacement for adequate physical memory. Indeed, I seem to recall pointing out that on large multiuser machines the worst thing in the world is to have inadequate physical memory. However, I find VM an essential tool to have present. For example, if you have a computer with 16MB physical RAM, 99% of it already in use, and need to open just one more app, VM will let you do it with a slight performance hit (mostly seen on startup of the app).

>>Every personal computer CPU from the 68030 and 386 onward has had the

>
> The entire computer doesn't have to be on the cpu's die you know...

Of course not. The point was that from those CPUs onward, you didn't have to pay extra for a second chip to do it. (Actually, in the case of the x86, there has never been an external MMU. And in the 680x0 series, only the 68020 had the ability to interface to an external MMU.)

>>should not ever see a bad VM hit.

Virtual memory is not the real issue here that slows down MacOS and
makes extremely powerful hardware seem slow.

Virtual memory on any platform is obviously not as fast as real RAM.

Uwe Seimet's implementation of VM is probably the fastest and most
intelligent of any. A reasonable swap partition with Outside does not
suffer much in the way of noticeable performance hit.

The real issue here is that disk based OS' like Win and Mac spend so
much time accessing the hard drive for simple procedures that we take
for granted with smaller RAM or ROM based OS' like TOS and the other
replacement OS' available to Atari users.

An example I use often, open a folder that contains many files such as
a CD ROM and watch MacOS on a PPC slowly draw the contents of that
window.

This is the real bottleneck in disk based OS'. They access the hit the
hard drive so often that performance is noticeably hindered.

Applications on TOS computers execute faster, occupy less physical
memory and are highly optimized.

The main reason for this is simple. Atari developers are not large
corporations. large corporatiions are more concerned about getting
their products onto the shelf. Hence, they program in high level
languages and spend very little time optimizing the software.

Atari programmers on the other hand, do it for the love of the machine
and enjoy the satisfaction of achieving great things from small code.
Many Atari programmers work in machine assembly code, a corporate no-no
in the Mac and PC market.

All the best,
Chris @ Computer Direct

Virtual memory should not slow down the machine. I am running a Linux box and although I used to have 16MB of memory, I required much more to compile my programs - about another 16MB in fact. Without VM this wouldn't be possible. When I compiled, my hard disk thrashed itself to pieces, but at least things worked (albeit quite slowly).

Now I have 32MB and compilation times are far better as there is enough memory that programs can proceed a reasonable distance before having to load in a bit more.

However it is not the case that you need more real memory than you have processes running. In Linux although I have alot of processes "running", quite a few only wake up now and again. These can be swapped to disk to free physical memory. For instance all the gettys on my machine (which I log in on) are swapped out to disk.

ATM for instance over 3MB of physical memory is being saved:
```
total used free shared buffers cached
Mem: 31252 29144 2108 10700 2452 15624
-/+ buffers: 11068 20184
Swap: 48888 3372 45516
```

Some OSes (probably experimental ones) try and work out how much memory each program will need in order to proceed at a reasonable rate. If the total of these requirements is greater than the physical memory, then it pauses one of them for a while and swaps it to disk so that the other processes can have the amount of memory they require.

Virtual memory is not too difficult to implement and since memory protection normally works well with it, there is no reason to disable it.

Linux uses a huge amount of memory for caching (as you can see) and varies the size of this cache dynamically. When I was compiling, I used to have very little cache left as Linux thought it would be faster to use the memory for actual processes. Now I have 32MB, it still has a sizeable amount of cache.

As for GPFs in Windows, well the memory protection doesn't work. If it did then you wouldn't have to reboot. At the very least something in the critical parts of the system are getting corrupted when they shouldn't. I have never written a program which has crashed my Linux box - this is why developing on a Unix box is so nice compared to windows when you might have to reboot several times an hour!

Adrian

>Virtual memory should not slow down the machine.

Bullcrap. If you can find a hard drive that has 60ns access time, and costs less than the National Debt, I'll agree with you. Until then, VM can't be as fast as real memory and therefor MUST slow down the computer - it's a physical reality like gravity. FAST hard drives typically have 9 ms access time - 1000 times slower, more-or-less, than RAM. And transfer rates are typically on the order of 1 to 3 megabytes per second, versus RAM transfers of 2000 megabytes per second on a 33 MHz memory bus.

VM slows down computers. QED. That's why our servers (in the software lab here) typically run between 256 and 512 megabytes of RAM with VM turned off.

## 889. Oasis 1.35 patches

Newsgroup: comp.sys.atari.st
Date: 1997-01-15 00:00:00 UTC
From: bkozlowski@nordnet.fr
Message-ID: <853354824_OASIS_@nordnet.fr>
Source record: 129991
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,demon.ip.support.atari

[followups directed to the Atari tech group only]

Hello all!

Some time ago in a discussion with Guy Harrison we found that Oasis doesn't give environment variables to called programs, like NOS or an external editor. And this is a problem for time and timezones in NOS, to find INF or KRZ files for Everest, etc...

Here is a little patch to correct the bug: edit OASIS.PRG with a binary editor, find the sequence 2F4A 0012 (there is only one in 1.35, at +30D96) and replace it by 42AF 0012. This changes a move.l to a clr.l for the envp parameter of a gemdos Pexec call.

Note to pre-1.35 users: if there is more than one sequence like this, try to find 2F4A 0012 205F 74C8 (and edit only the first word). And don't forget to edit only a copy...

Now NOS receives all your environment variables, like TZ=MET-1 or NOS_ROOT=j:\oasis (without trailing backslash). NROWS=30 does not seem to work, at least in NOS_POP3. And Everest receives EVEREST=e:\utils\texte\everest.35e\ (with a trailing backslash this time) and finds it's config files in it's own directory, no need to maintain a copy in J:\OASIS\.

But now you have a problem, if you have a TZ variable you have a double correction in NOS: the TZ offset and the system clock changed (to GMT) by Oasis... and you're fed up with Oasis changing the clock, with all related problems (innaccuracy, crashes...). 3 bytes to change, and it's history: always in OASIS.PRG go to +1853, +2FFCD and +30067, and there replace bytes 41 by 71. This changes trap #1 (4E41) calls to gemdos Tsettime and Tsetdate to nop (4E71).

You can also change the "s" of "Organisation:" to a "z", and replace twice two underlines(?) "__" by two minus signs "--", the first time is the mail sig separator, the second is for news. No, I don't know how to add a space at the end...

Bye! Bruno.

PS: Do you have a backup of OASIS.PRG? Sure? Because I perhaps made a mistake typing this text, or there is somewhere a side effect I haven't detected in two days of use...

I doubt that you really want to spend US$150 for a new keyboard, when all you need is a plug and a crimping tool. I'm not sure where to find them in Kiwiland, but I got a crimper and a package of 6 plugs at Radio Shack for about $10 or $20 total. It's a standard RJ-45(?) plug, used for 6-conductor telephone cords.

Replacement procedure:

(1) Make a note (on paper, don't be like me and think you can remember it!) of the order in which the wires lie in the plug - each is a different color, so turn the plug with the broken side up (gold wires underneath) and write down the color order.

(2) Cut off the old plug, strip back about 20mm of the outer cover, and use the crimper to strip the proper amount from the end of each of the inner wires.

(3) Push the wires into the plug (you'll have to bend them each a little so that they end up parallel intead of fanned out) and squeeze the crimper. This may be easier if you put the plug into the crimper first.

That's it. Test to make sure the connections are correct by plugging it in and typing each key (with shift, control, and alt as seems apropos), and check the mouse and joystick ports for proper function.

Now, I recommend you unplug it, buy a "double-female" 6-pin phone coupler and a flat phone extension cable (also with 6 conductors - I haven't been able to find one shorter than 25 feet). Put the couple on the end of the keyboard cabel and never take it off again - it's MUCH easier to replace the extension cable (or one of its plugs) when the next little cheap plastic plug breaks!

>
>I HAVE A 1040MAND THE FLOPPY A DRIVE BUSTED
>
>CAN I USE A DRIVE FROM ANY PLATFORM?

Yup... Just go to your local garage clone dealer and get a new
drive mechanism. If the drive manuf. is different from your old
one (such as epson) you might have to cut up your old case a bit
however.

Just tell the garage clone dealer to make sure the drive is set
up as drive a. At that point, you should just be able to plug
it into the old connections in the 1040 and have it work.

The drive mech should be no more than 50 bux.

On a slightly different note...
Has anyone ever attempted to use a floppy tape
drive on any of the Atari's?

: Can an NEC multisynch plus work with an STE? Box needed?

Any multisync monitor that can sync down to frequencies of ~15 kHz should work. Of course, many modern multisyncs will no longer do that. You will need an adaptor for the STe's monitor port, which shouldn't be too hard to obtain or make.

>unable to even rollover from 99 to 00?

In all fairness, it turns out that Win95 is OK for the year 2000, at least
(though I understand it will fail a few years later). MS-DOS, however,
can't deal with the years 2000+, and there are thousands of accounting
packages running on PCs that store the date with only a 2-digit year.
Should be interesting to see the results of some of those loan interest
calculations - I think with a negative 100 years accumulated interest, your
loan should be completely paid off. <G>

MULTISYNCH MONITORS
COLOR AND HIGH RESOLUTION MONOCHROME
DISPLAY FOR THE ATARI STs

COLOR BETTERS THE ST'S SC1224

Most multisynch monitors, but not all, will work with the
ST's RGB output and vertical refresh rate. Advantages are
operation in high resolution monochrome and both low and medium
color using a single monitor. An additional advantage is the
better color rendition with more differentiation in tonalities.
Subtle shades are better represented than on the ST. With Sony
color monitors, the colors are Kodachrome in quality -- rich
and saturated. On the negative side, none of these color
monitors will match the sharpness of the Atari SM124 monochrome
monitor. This monitor, as with other monochromes, uses single
pells or pixels to represent screen images. Color monitors
must use three (Red, Green, and Blue) to form the same point on
a screen. As a consequence, they cannot give the crispness and
detail.

THE CRITICAL TEST -- MONOCHROME SHARPNESS

If you use monochrome most of the time, as many do with
Spectre Macintosh emulation, the major question is whether or
not a softer and coarser monochrome display on a color monitor
is acceptable for continuous use. It doesn't make sense or
cents to buy one of the lower priced multisynch monitors as an
economy measure just to obviate the need for two monitors where
high resolution monochrome is important. And the purchase of a
higher quality and higher priced monitor in the $600 to $650

range -- such as the Sony 1304 HG or NEC 3D may not make much economical sense either. However there are those who continue to have the desire for these types of monitors -- unfortunately, I am one.

MONITOR SWITCH BOX -- ROLL YOUR OWN

The following pages give pinouts and wiring diagrams for construction of a Monitor Switch Box so that a multisynch can be used in both color and monochrome with the ST's monitor output. The box is needed to ground the Monochrome Detect line from the ST and force it to boot in high resolution monochrome. It also switches from the ST's RGB color output to Monochrome Intensity output to drive the monitor. The pinouts for all three Sony monitors (1302, 1303, and 1304) are the same. NEC monitors such as the Multisynch and Multisynch II use the same pinouts. Where Sony and earlier NECs use DB-9 inputs, the new NEC 3D uses a DB-15 connector. The NEC pinouts shown are still valid for the 3D. A converter cable -- DB-9 to DB-15 supplied by NEC -- will give the proper interface. This converter is also availabe commercially as a one piece plug unit. Other monitors, such as the Mitsubishi Diamondscan, use different plugs. The Mitsubishi uses a DB-25 which is the same in pins and shell as an RS-232. The ST's output can be routed to these monitors with the proper pinouts and plug.

The Monitor Switch Box can be wired for any monitor output configuration. If another monitor is used, a simple conversion plug is comercially available to reconfigure outputs if both monitors use DB-9 plugs. If plugs are different for two monitors, then wire a cable with the two different terminations. The least effort and highest cost approach is to buy a cable with one of the plugs already made up. If you are good with a soldering iron, then buy the connectors and makeup your own cables. The ST 13-pin DIN plug is not that easy to work with. The solder or rear side has pins just like the front, and soldering wires to these contacts is not a snap. ST monitor cables, with a DIN 13 male on one end and unterminated on the other, are available from two or three sources. Try Best Electronics or Practical Solutions. A 4-pole, double throw switch (On-On) will be required for the Box. Also fit the Box with an RCA jack if you want sound routed to a stereo or self amplified speaker like those available from Radio Shack. If you have Tweety Board, this will not be needed.

MARKET FAILURE OF SWITCH BOXES

There have been several attempts to market these monitor switch boxes, and all but the most recent have not met with success. The first reason is high price. The first box produced was overpriced in the $200 range. The second reason is differences in pinouts and plug configurations for the

variety of monitor inputs. There is no standard. The third reason for lack of success is the small ST market for alternative multisynch monitors.

Making your own box for $35 or less in parts will give you an opportunity to try out several monitors at a dealer and select the one that is most acceptable for high resolution monochrome display. But a problem is that most dealers don't have the more expensive monitors broken out for display, and you may not be able to give one a try. Be persistant. Ask the dealer if he can recommend a customer that has a monitor you are interested in. But by all means, try before you buy to insure that the display meets with your satisfaction. Don't take the word of others because each has different levels of acceptability.

MULTISYNCH MONITOR PERFORMANCE

I have tried the homebrew Monitor Switch Box with the Sony 1303 and the NEC Multisync and Multisync II. The 1303 is not the quality of the 1302 which has a finer dot pitch. However, the color was excellent but the monochrome display was soft. The Sony 1302 has a .26mm dot pitch. This is a measure of the center-to-center distance between dots and is also an indicator of dot or pixel size. Until recently, the 1302 had the finest dot pitch of any color monitor on the market. And dot pitch is a better indicator of sharpeness than horizontal and vertical lines of resolution. The lines are also a function of screen display size; so don't be mislead by more lines resolution. It simply might correspond to a larger monitor display size. And as the monitor size increases, the dots are made larger and render a less sharp display.

But Sony is less than forthcoming in its specifications for the 1302. While touting the .26mm dot pitch, they don't publish the fact that this applies to horizontal spacing only. The vertical spacing is different, perhaps .32mm which is nothing to shout about. As a consequence, you may see black horizontal lines that separate the color display lines. They are not dramatically obtrusive, but they are there. On the plus side, the Sony's have that superb Kodachrome color that is richly saturated. The blacks are black, and the background in monochrome is absolutely paper white. The 1302 is satisfactory for ST monochrome use.

This model is being superseded by the new 1304 HG that has a .25mm dot pitch. The specifications on this new monitor closely match those of the Apple Color Monitor for the Mac II. This monitor is made by Sony to Apple's specifications, but it is not multisynch. I use one on a Mac II and it is excellent in both monochrome and color. Because of the closeness in specifications -- the only two monitors available with a .25mm

dot pitch -- I strongly suspicion that they are the same. Sony has simply adapted the Apple version for multisynch use. And if I were to place my money on a monitor that would be highly acceptable for monochrome display with the ST (sight unseen in an actual test), it would be the Sony 1304 HG. When viewed in color on an IBM PC, the dots appeared extremely fine and it appears that the .25 pitch holds true for both vertical and horizontal.

The 1303 is not as good as the 1302 or 1304. However it did give a good monochrome display that was similar in size to the ST's color display in medium resolution. Although good, it does not come close to matching quality of the SM124. Since I spend at least 60 percent or more of my time in Spectre/Macintosh operation, I felt that this was not acceptable for my requirements. When switching from color to monochrome, the screen picture sizes must be readjusted. When the color picture fills out the screen, the monochrome picture will be half screen size until it is adjusted. The Sony controls are in the rear, making them very inconvenient for this operation. The NEC and NEC II have their controls on the front. When making adjustments, insure that horizontal positioning is correct. When first tested, the NEC seemed to have ghosting with the character display. However this was because the screen had wrapped around and required proper positioning. The NEC display was also good. But it was not the equal of Sony in color -- more pastel and less saturated.

Both the Sony 1304 and NEC 3D now have automatic screen sizing when displays are changed; so this should eliminate annoying adjustments. Additionally, both are improved over earlier models. Both would perhaps make acceptable choices for monochrome use on the ST. But I would still think that the Sony 1304 would win by more than a hair if it is anything like the Apple Macintosh monitor. Perhaps a dealer will break one out for testing when they become more plentiful and prices drop.

Sony 1304s are discounted for around $645, and 1302s for $575. NEC 3Ds are lower priced at $585. The Mitsubishi Diamond scan can be found at $499 and sometimes lower. If the 16" Nano FlexScan is a true multisynch, those who want everything can get it for just under $900.

EDITOR'S NOTE: These prices were for new monitors in 1990; you should be able to buy any used monitor for well under $200 in 1996.

The following should get you started on a switch box so that you can perform your own acceptance testing. I have not tried a Princeton Graphics or Mitsubishi Diamondscan since I felt that their displays with the IBM PC were not the match of the Sony or NEC. It wasn't worth the money or effort for such

a change, and a promise was made a long time ago not to
compromise and throw money at something you wouldn't be
satisfied with. Climbing out of that hole is too costly, and I
have paid this price in both camera and stereo equipment -- but
never again.

Ground 13 1 6, 7, 8, 9

NOTES: Sony 1302, 1303, and 1304 use the same pinouts.
The above can be used for the NEC 3D with a DB-9 to DB-15
conversion cable supplied as standard with the 3D.
ST 13-pin DIN cables with male DIN and unterminated at the other
end and DB-9 plug/unterminated are commercially available.

EDITOR'S NOTE: Try Best Electronics in North America - or, if you have a broken SC1224, "steal" the monitor cable from it. You will need to add a couple of extra wires for monochrome use in that case.

The NEC DB-9 to DB-15 converter can also be purchased seperately.
If problems are encountered with the NEC 3D, try disconnecting
some of the grounds on pins 6, 7, 8, and 9.

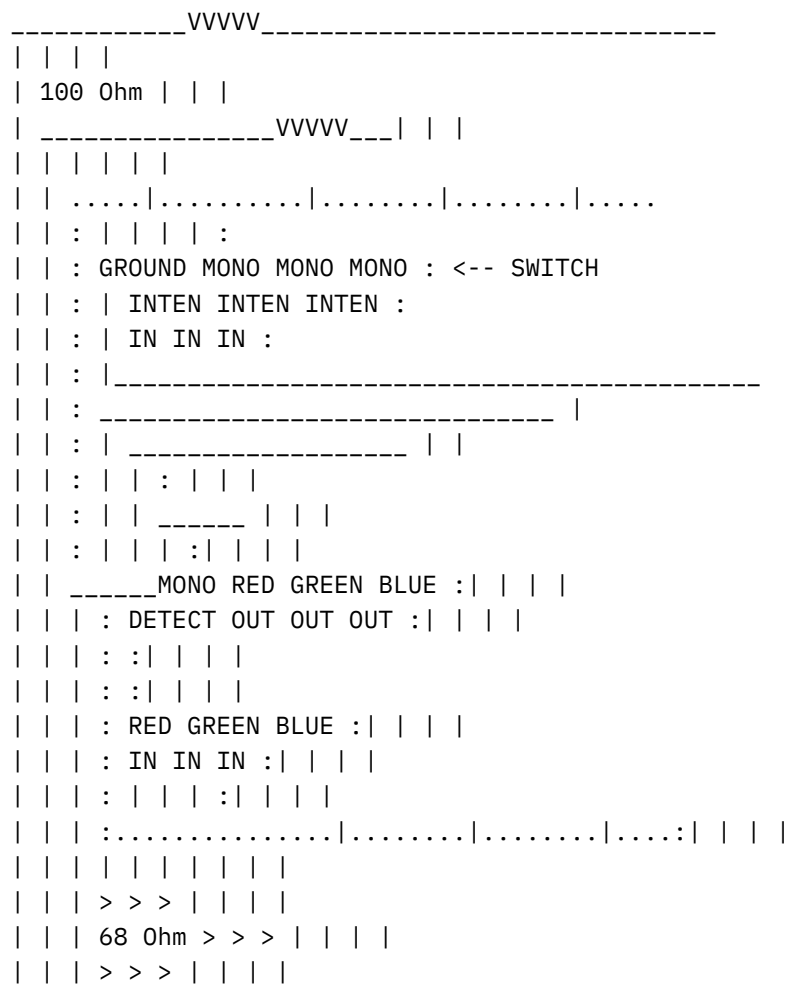
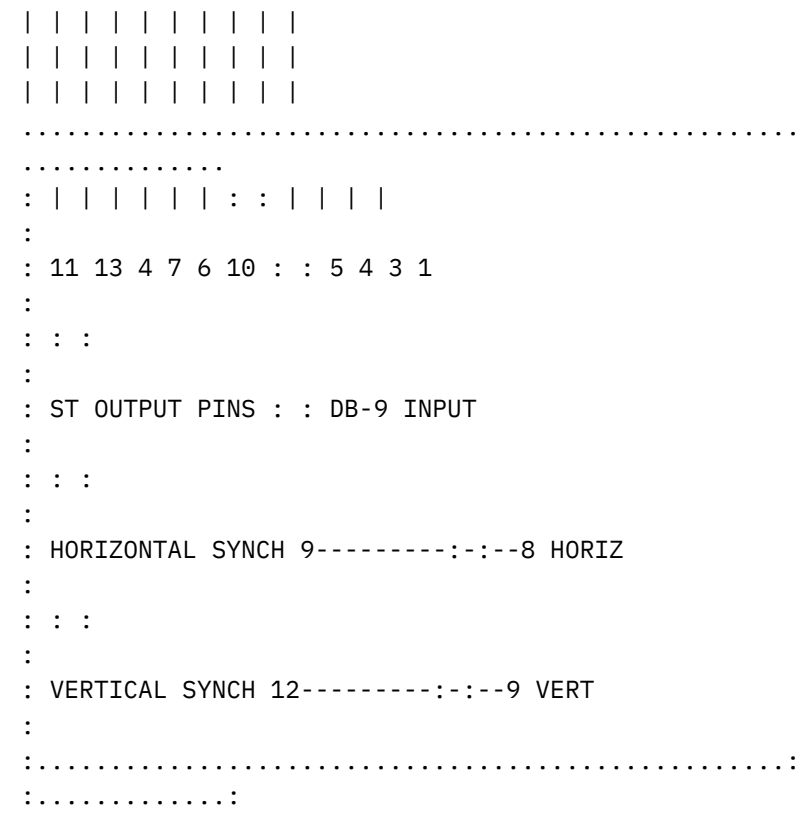
This plug is available in most electronic supply stores. One end is DB-9 Female for connecting to the box's output cable, and the other end is DB-9 Male that plugs into the Monitor or the DB-9 to DB-15 cable for the NEC 3D. The converter has a small printed circuit board with jumper wires to make the proper input/output configuration. The pinouts shown above are for a switch box wired for Sony output and their conversion to output configuration for a NEC monitor.

MULTISYNCH SWITCH WIRING ST DIN 13 OUT TO SONY DB-9
4-POLE DOUBLE THROW ON-ON





Center poles of switch (labeled as RED, GREEN, and BLUE OUT)
are common output to the Sony monitor through the DB-9
connector. When switch is thrown to COLOR side (lower contacts),
the ST's RGB output is fed to the common output center poles.
Monochrome Detect has no output in COLOR. With the switch thrown
to MONOCHROME (upper contacts), Monochrome Detect is grounded and
Monochrome Intensity is fed to the three RGB outputs. Horizontal
and Vertical Synchs are fed straight through from the ST to DB-9
connector. Thanks to Mike Odegard for the original circuit in
file #5617 uploaded in January 1988. It works much better than
my circuit that didn't use resistance.

Hi,

Is there a "find file" program similar to that on a Mac for the ST which
will search mounted volumes for the selected file, show you the path to
the file and/or allow you to run (access) the file from there.
Navigating and searching multiple mounted volumes get tedious.

## 906. Defragment HD? Virus Software for HD?

# 910. Re: Writing to Atari disks from a PC

Newsgroup: comp.sys.atari.st
Date: 1997-01-15 00:00:00 UTC
From: amajorel@teaser.fr
Message-ID: <5bhid5$18t$1@news.teaser.fr>
Source record: 130012

More technical info on your question about swapping floppies between PC and ST :

I used to read and write PC FDs on my ST and vice versa and it appeared that the only important difference between a 3DD (720kB) TOS disk and a 3DD MS-DOS disk is that the first 3 bytes of the boot sector are EB 3C 90 for MS-DOS and something else for TOS.

TOS doesn't care about what the first 3 bytes are so you can read PC disks on a ST. But MS-DOS requires the first 3 bytes to be EB 3C 90.

If you ever need to read/write on a PC a disk formatted on an ST, you have the resource to overwrite the said first 3 bytes of the boot sector with EB 3C 90. I may even write a 10-line C program to do it if you want (mail me at <amajorel@teaser.fr>)

Attention: I'm not sure but maybe TOS rewrites the boot sector of the disk it reads or writes thereby replacing EB 3C 90 by something else. Maybe not but bear this in mind if a disk becomes suddenly unreadable by your PC...

Attention2: You won't be able to read disks formatted by Superformat 2.2 (I think that was its name) because it wrongly puts 0 in the "head#" field of the header of the sectors in the second side. I have not found a workaround. Would require writing a special device driver. But that's not what you want to do anyway...

## 915. Iomega Jaz on Falcon?

Newsgroup: comp.sys.atari.st
Date: 1997-01-15 00:00:00 UTC
From: robert@informix.com
Message-ID: <5bhbbn$9h4@news.informix.com>
Source record: 130035

Hi,

I was interested in purchasing an Iomega Jaz drive for my Windows box, but I might get an external version if I could also use it with my Falcon. I know the Falcon came with SCSI ports, so I should be able to connect it, but it doesn't look like Iomega has any drivers for Atari. Is there a solution to this problem...i.e. does someone provide 3rd party drivers, or do there exist shareware/freeware drivers, etc?

Also, if this turns out to be doable, will the connection work at full speed (i.e. will I be able to use it to do hard disk digital recording?)

Thanks,
Robert C.

h> lot of graphical programs (viewers, icon editors, painting programs
h> etc.).

I've had this before. It has always followed a crash of some type. Whenever
you see bombs, even if it appears you are able to continue, you should always
save everything you can and reboot. You'll only run the risk of it getting
worse if you don't.

You're thinking of the MegaST, I think. Yours sounds exactly the same as my MSTe.

Do you have the phone-jack type of connections at both ends of the keyboard lead? I think that's the only difference. Mine only has one at the computer end B^{<

*Hi Gary*, on 14 Jan 97 you wrote: ...respect, brethren

G>
G> I need a program that will constantly display the current time in the
G> menu bar.

For this I always recommend Menuinfo.

==========
C The current version MenuInfo

The current version of MenuInfo is always available in the "Öffentlicher Programmteil" of the Maus MK2 (+49 2371 944925).

A few days or weeks later the current version is available via FTP (members.aol.com/DirkHage/atari/). You can find a link to the current version on my World Wide Web site. Just take a look at:

http://members.aol.com/DirkHage/www/eng/menuinfo.htm

The archive is named always "MINF???.LZH", "???" is replaced by the number of version.
==========

Current version, last time I looked, was 2.49

G> It needs to be compatible with a Falcon running MagiC5.

Runs as ACC, PRG and APP from Auto\Apps

G> Does anyone know of a program that will do this for me?

It shows more than just the time - very good for programmer types like your good self...

G> It needs to be compatible with a Falcon running MagiC5.
G> Does anyone know of a program that will do this for me?

Well, I'm using Ledpanel on my STM/MagiC v2. It gives you "drive lights" to indicated partition accesses as well.

I know people who run it on a Falc. so you should be OK.

Hi 100316.1215@CompuServe.COM, on 14 Jan 97 you wrote:

1> Can anyone tell me what desk accessories are?

They are utilities which are loaded at boot time and remain resident until the next re-set. On a normal ST you can have up to 6 of them and they are accessed by the leftmost desktop menu. The acc programs will have the file-extender .ACC.

1> something to do with a boot disc? If so, how do I make a boot
1> disc?

Just put the *.ACCs you want in the root directory of the floppy you have loaded when you boot up.

I am new to Internet etc

I have an Atari 1040STFM with 4mb Ram and 350 mb Hard Disk

Should I be able to run Oasis on it without hanging on exit etc.

Should file TOOLS.CFG come with download, or does Oasis create it, or do
I create it!

Where OH! where may I download Oasis v2.1 from?

ftp.demon.co.uk hasn't got it and ftp.cnam.fr has only a partial TOS file.

I haven't yet mastered the WEB!

This 53yr old would be dog paddler would appreciate any help, advice etc going.

I am a 53yr old still winding my way through the Internet.

My hardware is Atari 1040STFM with 4mb Ram + 350mb Hard Disk using TOS v1.02

Should I be able to run NOS v4.2 using PPP if so how?

Is there a later version of NOS available that I can use on my machine?

Any help or advice would be appreciated

This is because you don't need any particular driver. Any driver that
supports removable drives will do, i. e. even AHDI will work. If you
want to use special features of your ZIP, namely the read/write
protection with password, you need HDRIVER.
(acp5.chemie.uni-kl.de/pub/atari/hddriver61_demo.zip)

No, the ZIP is too slow for this.

You do not need any special drivers, plug and play. If you want to get
the most out of the Jazz, I would recommend HD Driver. It has support
for all the extra features of jazz such as Write protect and password
protect as well HD Driver is able to partition the cartridge with DOS
compatibility by using the enclosed BOGDOS utility thereby allowing
for easy sharing of data between the machines.

> Also, if this turns out to be doable, will the connection work at
>full speed (i.e. will I be able to use it to do hard disk digital recording?)

By all means, HD recording is very doable on a falcon to a Jazz drive.

The Jazz is a very capable drive for this purpose.

All the best,
Chris @ Computer Direct

PNG - Portable Network Graphics (pronounced "PING") - has certainly had a slow start. But in October last year it was at last officially adopted by the W3C (World Wide Web Consortium) as a recommended replacement for GIF. Should one or both of the Web browser giants (Netscape and Microsoft) now finally start supporting it, I think we will see a very rapid growth in its use.

PNG uses the the ZIP deflation compression as opposed to the LZW compression of GIF. Despite that LZW is less effective, it is patented by the company Unisys that has the impudence to demand royalty for it. ZIP deflation, on the other hand, is royalty free.

In addition to the royalty issue, the PNG format has the following main advantages over GIF:

+ Sligthly more compact (10%-30%) due to the superiority of ZIP deflation over the precious LZW of Unisys.

+ Supports TRUE COLOUR images (GIF supports a maximum of 256 colours.)

+ Information on "Gamma Correction" included in the file format (Allowing software to correct the brightness of pictures produced with different hardware.)

+ Two-dimensional interlacing scheme (compared to the one-dimensional of GIF). The point of interlacing is with slow electronic transmission, when an interlaced image allows the browsing software to quickly render a low-resolution first impression of the image.

+ Allows variable transparency ("alpha channel"). (Compared to the simple on-off transparency of GIF's single transparent colour.)

The only thing that GIF has, that PNG has not, is support for multi-image (animated) files. This was a deliberate decision to keep the format simple. The PNG people are however currently working on a multi-image

format - MNG - that will be based on PNG and most likely blow the socks off animated GIFs in every way.

Note: PNG (and MNG) is a LOSSLESS format (like GIF but unlike JPEG and MPEG) which is an advantage with images that needs to be edited and re-edited. Each time a JPEG image is edited (and even just cropping it counts as editing), saved and re-loaded it will lose something of its quality. On the other hand it also means that PNG in most cases is not nearly as effectively compressed as JPEG. (The exception is images with few colours and sharp contrasts, where PNG may even beat JPEG.)

For more information about PNG turn to the PNG home page at:

http://quest.jpl.nasa.gov/PNG/png.html

Apparently all the Mega STEs and C-Lab Falcons I've seen are mutants, as they all came with the old original Mega ST keyboard.

Until I made this inadvertent slip-up in my Usenet post to c.s.a.s, I was unaware of a "genuine" Mega-STE keyboard - I thought that Atari, in it's infinite strive for cost-cutting, had simply shipped the old Mega ST keyboard with the Mega STE.

I stand corrected.

BTW: Can someone point me to a retailer for a new (UK-spec) TT keyboard - the plug at the end of the keyboard cable that goes into the TT has broken due to my ham-fistedness in trying to make it click into place and stay there (the little "arm" piece that clicks into place and holds the plug in place snapped when I tried to widen the gap between it and the plug part by a few millimetres).

: I was interested in purchasing an Iomega Jaz drive for my Windows
: box, but I might get an external version if I could also use it with my
: Falcon. I know the Falcon came with SCSI ports, so I should be able to
: connect it, but it doesn't look like Iomega has any drivers for Atari. Is
: there a solution to this problem...i.e. does someone provide 3rd party
: drivers, or do there exist shareware/freeware drivers, etc?

HD-Driver works...and is acclaimed by many as the best/fastest driver
around. I use it with my Falcon, and Hard Drive recording (no jaz drive).
One advantage to using this driver is that it should allow you to use
DOS formatted hard-disks with your Falcon...hence you could easily read
and write files back and fro between the Falcon and PC. I've not
tried this myself...but have heard of people doing it successfuly.

ICD Pro should work...not sure on this one...but it should...so if you've
already got it...give it a try :) Really...any driver that supports
removeable media should work.

I've heard rumor that HiSoft has something designed especially for Zip/Jaz
drives (Is this called Squirrle Toos?). This package is supposed to
support special zip/jaz functions like password protected disks.
I don't know if this is true drivers from the ground up...if it's just
some great tools to complement your existing driver...or if it even really
exists yet...just something I recall reading someplace.

: Also, if this turns out to be doable, will the connection work at
: full speed (i.e. will I be able to use it to do hard disk digital recording?)

Oh yeah...provided the Drive is fast enough...
I've heard it is...and am thinking of buying a Jaz myself.
You might seek someone who has tried it...I too would like to know
how well the Jaz performs with CAB.

I'm not sure what kind of port the Jaz drive has on it...I'm assumeing
50 pin centronics. If this is true...all you need to hook it to the
Falcon is a cable with a SCSI II plug on one end, and Centronics on the
other...or if you've already installed an external SCSI device, what
ever cable daisy chains the two (most likely 50 cen to 50 cen).

Body handling: HTML body converted to readable text

I just got a Zip drive for Christmas and would like to use it with my
Falcon (it's an external SCSI model). Sorry to sound so thick here,
but what leads do I need to get in order to use it ?? I'd like to
connect my existing HD thru the Zip as well.

Please send your replies to my email address at
felice@rushden.demon.co.uk - as this one above isn't my own private one.

Speak to some dude soon, eh ??

You could try a repair, Maplin have them FCC68 modular plugs Part JW41U.
I have been amazed at the parts that Maplin stock that are used in the
TT. The small clock battery is stocked by them as well as the unusual
connectors (14pin and 13pin).

So give it a go for 49p !!!!

Roy (et.al.),

Have you gotten the "STiK-KRfree()/Memory corruption detected" message only when using WebCrawler in CAB, as I have? Or do you experience it elsewhere, too?

If it's only in WebCrawler, then maybe we need to move the discussion to the "problem web pages for CAB" thread. Maybe they've recently rewritten their site in some odd way?

Cheers,

Doug Kendall

Until recently, this all depended upon how much money you had to
throw at the task. Win3/Sys7 both date back to the $50/M days.

Until relatively recently, I didn't have the $1600 it would have
taken to get a modern OS to the same level of comfort with respect
to physical memory as I would have on a 4M ST.

>>
>>How can you consider ROM based operating systems to be " mired in the

Virtual memory has been given much more hype than it deserves.
While sitting on the other side of the fence it seemed like a
good and rather nifty idea. However, after actually using
micro systems that were dependent upon virtual memory, I found
it to be more of a curse, actually. It encourages and allows
developers to work outside the common hardware constraints. The
end result is performance that can deteriorate past the point of

a 8Mhz MC68000.

Fortunately, memory prices have dropped to the point where buying adequate hardware (memory) for the software is a practical option.

VM as a memory management tool has some merit. VM as a replacement for adequate physical memory is more backwards than any TOS or GEOS. It's cripples the 'modern' machines that have, until relatively recently, been dependent upon it [VM].

I wouldn't be surprised if core memory were faster...

>Every personal computer CPU from the 68030 and 386 onward has had the
>hardware to support it.

The entire computer doesn't have to be on the cpu's die you know...

Defrag: best available is Diamond Edge (it also has the facilities to back up your SCSI partition tables and scan the drives for errors, with automatic correction). Contact Oregon Research for the latest version.

UVK (Richard Karsmaker, I believe) is the best virus detection/removal system for the ST. A freeware virus killer is called "Virus Killer" (creative, eh?) and will detect and remove most floppy boot sector viruses.

I don't have immediate contact information for either of these folx, but OR is available through Long Distance information - they're in Tigard, Oregon, area code 503.

Besides doing this, I HAVE to save the file with a *.ZIP
extension so the server sends it to me in binary mode. After that, in my
computer, I can rename the file and proceed with the decompressing.

You can ask to standarize, once for all, to ZIP; is the best.

hmm from what I saw RATEHD is not teh prog to test the speed your
drives.. Here it is totally inaccurate..
For a JAZ it says 850kb/sec!!!!
When my old scsi1 340 meg do 1000kb/sec in ratehd..
And the JAZ can do up ( min 3.4 meg/sec- max 6.5meg/sec)
If I use Howfast the results are totally different..
I get the JAZ faster than my old scsi 340..:)
I have for the JAZ and howfast.prg 1.5 meg/sec .
And the old scsi 340 it says 0.6 meg/sec , which is closer to the
reality.
From what I understood, teh scsi port of the falcon has a max of
2meg/sec.
So if you have 4meg/sec you won't see any difference..
On the IDE however it can go up, way up...
But for Cubase audio, if your scsi drive can do 1.8meg/sec then the
whole 16 tracks are available no problemo. (should).
But an IDE at 3 meg/sec won't do it. :p
Caubase audio uses special scsi command that would suffice for your
scsi drive.. At 1.8 meg /sec. you have plenty..
Bye..

Yes, I get that too, using Everest on TOS 2.06, though in color. I
haven't determined exactly what the culprit is but I think it is a VDI
thing. I've duplicated it by writing a program that does nothing but
open a virtual workstation then exit without closing it. If Everest
runs after that, I get the symptom you describe. Actually if I had to
guess I'd say Everest is failing to specify a vst_alignment() setting,
and instead assuming it will be a certain way when the workstation is
opened. It's on a list of a few things I'd like to bring to the
attention of Everest's author, but I haven't been able to reach him.

# 962. Re: Atari clock/2000 AD

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: "Alastair J. Houghton" <ajh8@doc.ic.ac.uk>
Message-ID: <32DE848A.41C67EA6@doc.ic.ac.uk>
Source record: 129882

The year 2000 problem. Yes, some ST computers will have problems, but not because of the software; Mega STs (and Mega STEs and TTs) all have built-in real time clocks. I don't know about the Mega STE and TT, but the Mega ST's realtime clock only has two digits for the year.

I can't remember what happened the last time that I set my system date to something silly, but the problem is there. Even if it wasn't, a similar (but far far worse) problem will descend on STs and PCs alike in around 2200 (I don't recall exactly which year, but it's around then), when the DOS/GEMDOS part of the OS suddenly finds that it doesn't know what year it is any more (it should wrap around to 1980). Perhaps people should be concentrating on fixing the entire business of dates and times and not just the Y2K problem.

As for other computers, I'm fairly certain that many will have problems - despite reassurances from manufacturers - as applications software doesn't always do quite the right thing... I already know of various programs that think that the year 2000 is a leap year (blatantly untrue), and I believe that the RTC chip in the Mega STs also believes this. Oh well. That's life, I guess.

>specific "Corporations", I think you should be able to figure out to
>whom I reference this point to.

Perhaps I read too much into your comment, then.

Nonetheless, there are still plenty of *corporations* that have dedicated
programmers. I dislike some of Adobe's business practices as much as
anyone, but they have long used highly skilled programmers to write tight
assembly code for Photoshop filters.

>>Assembly is hardly a "corporate no-no". There are tons of commercial
>>programs which use it.
>
>Corporations are more concerned about getting their product onto the street
>on time and on budget, no time for optimizing.

See above. There are a large number of programs for which performance is
an important enough problem that optimizing does take place.

>The fact that simple apps come on multiple disks or CD's is a testament to
>this when compared to relatively similar apps written in tighter code.

Actually, with the proliferation of CDs, it's often cheaper to burn a
single CD than it is to dupe a single floppy. And as long as you've got
that much space, you might as well use it for something... like online
documentation, which is much more common on the Mac and PC.

To give you an example of a really well done Macintosh application,
consider Word Perfect 3.5 for Mac. It is a very nice, easy to use, full
featured word processor. It is hellaciously fast. And the core word
processor itself takes up just 5.6 MB on my disk (the app itself, and the
files necessary for spell and grammar checking). The remainder of the
files (file format conversion filters and various forms of online
documentation) occupy another 7 MB.

>>Writing programs entirely in assembly is out, though. There's no purpose
>
>It is "out" in the Mac and Win world because it takes too long, it is easier
>to use higher level languages.

It takes too long no matter what platform you're on.

> In the Atari world, it is "in" because a highly
>optimised app (or OS in the case of MagiC) can be run with decent speed on 9
>year old equipment.

Exactly. And even so, with the use of the 90/10 model I detailed, you
could get programs that ran just as fast, but were far easier to write and
maintain.

For example, GEM user interface code is very easy to deal with in C. Not
so in assembly. And you'll never notice the speed difference, because the
code is not CPU intensive, with the exception of GEM drawing routines.
The drawing routines of any OS are a great candidate for assembly.

> Navigating and searching multiple mounted volumes get tedious.

What desktop are yo using? If MagiC/Ease you can do this from the
desktop by selecting the drive icons you want searched, go under the
File menu and select the 'Find' option, type in the file mask you want
and let it go to it! You will be shown windows for all occurrences of
the mask.

If OTOH you're using the standard old TOS desktop, get the shareware
file selector 'Selectric' and use its very nice FIND function to search
for the file mask you specify.

There is no need to be concerned about it. It is a known 'feature' and is
mentioned in the STiK docs (readme.1st) :) Can't say I've ever had it myself
though!

Cheers, Gary

As far as I know, it's not the limit of the SCSI bus itself, but of the DMA
chip Atari has built into the Falcon. Is that correct?

Ciao

Thomas

There are a couple. I usually use the "find" function built into Little
Green Selector (it's always readily available), but a WHEREIS program exists
(probably several of them, actually).

I forgot to add to this post!

We have actually recorded and played back 6 tracks on ZIP. Not a
recommended drive, but it actually shows how fast this little
GEM of a drive is!

All the best,
Chris @ Computer Direct

I think I saw the patch on ftp.cnam.fr something like
pub/Atari/Disk/depat204.zip I'm sure that isn't the exact name but
it's not too hard to find, I looked just the other day.

There is, in fact, already an easy to set up MiNTNet PPP package. It's
called PPP-Kit. It seems to me that there would not be much point in making
another when this perfectly good one exists already.

Diamond Back from Oregon Research works with my Wangdat Data Dat.

I'm not familiar with the model you have, but there is only one
SCSI data dat that will work with audio DAT tapes, and I think
it's on an SGI machine. The two formats are different (although
the tapes are mostly the same, except for the longer lengths
offered for Data Dats.

j> Please include me as well.....thanks:-)

For you and anyone else, the mods to the SLMC804 controller PCB to allow the 804/605 to remain switched off yet allow the continued usage of the DMA are simple.

Open up the case and cut 7 connections between the 37-pin D connector and the PCB, pins 16-19 (top row, with outside of connector facing you these are on the right) and pins 35-37 (bottom row, under the connections already cut). These cuts isolate the +5V feed that is normally provided by the laser controller (the manual has a diagram of the connector).

Two wires need to be soldered to the large capacitor behind the D connector, and are connected to the new source of 5V, which could be provided by a standard "wall wart" (regulated supply recommended) and matching power connector, or by the ST itself, power requirement is low. Do take care to connect the feed to the cap. the right way round, negative is often marked by an arrow.

Mods are made at your own risk of course.

Regards, Derryck

He can use a number of programs to accomplish this.Here is a partial
list !
1) Oasis
2) Gluestick/Cab/Newsie/
3) Mintnet/Mint
4)PPP114Kit ( A combination of # 3 that is pre-configured and that you
don't need a Minix Partition .
What I would advise him to do is call his ISP to enquire if they also
have a SLIP protocol . If they do then the answer is to get either
Oasis or Stick/Cab because they are easier to install .*

## 990. Nemesis Falcon Accelerator

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: ied2@recursiv.demon.co.uk
Message-ID: <853406584snz@recursiv.demon.co.uk>
Source record: 129922

Just thought you may like to know that although the Nemesis board isn't available for you to install yourself yet, this is only because the instructions are not yet printed. The hardware is ready and if you don't mind having the manual forwarded at a later date, you can send your Falcon off to get the board fitted by professionals *now*.

There are three fitting centres in the UK:

1. Titan Design themselves, near Birmingham
2. TUS in Macclesfield
3. Black Scorpion in Scotland

If you're interested, email Titan Designs on: 100345.2350@compuserve.com, ring them on 0121-6936669, or fax them on 0121-4141630.

I've had mine fitted with the board for a few days now, here's a few benchmarks for you to peruse:

GemBench 4.03
---

Falcon 030/TOS 4.04/AES v3.40/GEMDOS v0.48/MiNT not present/
Blitter Enabled/NVDI 4.11 present/Video Mode: 640*480*16/
LineF FPU installed/Run and Malloc from STRAM

Yep. Did _you_ get the fact that Ataris are not involved in this
problem, for their clock will have this problem in the year 2102
(IIRC) and not in the year 2000?

lower case characters.

>CAN I USE A DRIVE FROM ANY PLATFORM?

Besides the plastic front, Atari disk drives are standard Shugart
bus ones (e.g. by Epson). If you find the same drive or one that is
compatible with the front of your defective original, you might even
avoid using a saw to replace yours.

M > and some other computer.

I recently got ex-Queen drummer Roger Taylor's HAPPINESS? CD,
and inside the booklet is a picture of the inside of his home
studio. If you take a look right in the back, you'll make out what
looks like a MegaSTe or a TT (Queen being at one time very
enthusiastic about STs). You can definitely make out an SM124
monitor.

BTW, I recommend this CD highly - the best album Pink Floyd
never made :)

i96mf@tay.ac.uk wrote:

> Am getting an ST at the weekend (without a monitor). Can someone advise
> me on the VDU connections for such a computer? Do they have TV tuners,
> VGA, phono, etc?

If it's an STFM - it has a phono-style socket output, which is a standard
TV signal from the inbuilt modulator, which you can use with any TV. It
also has a proprietary Atari monitor socket, which outputs to either an RGB
colour monitor or an Atari 640x400 monochrome monitor.

If it's an STe - same as above, essentially, except it'll also have a pair
of phono sockets which output the stereo sound signals, which you can
inject into any standard audio inputs.

ATB, Frank.

From the Holy Book of <32ddad1e32f778a@sn.no>
as spake by hallvart@sn.no (Hallvard Tangeraas) :

>I just downloaded a couple of .TOS files from a web page, using Lynx, and
>when I tried to run/de-compress them nothing happened, so apparently there
>has been some problems with the downloading...
>
>I seem to recall Lynx saying "text" while displaying the download format,
>which is ofcourse wrong for a binary file.

Yep. Most web servers are configured to attach a content type of
text/plain to a file if they can't figure out what type it really is.

>Is there anything I can do to set up Lynx to handle these files correctly,
>or does the person at the other end (the web page owner) have to change
>something (and what?- in case I contact that person with suggestions)?

On your end, try using the D)ownload command instead of just selecting
the link; it'll still be flagged as text/plain, but it should come
through intact.

On the author's end, if he's providing many .TOS files, he should
arrange for the server on his end to recognize these files as binary
files and flag them accordingly, probably with a content type of
application/octet-stream. Exactly how he would go about doing that
depends on what server is being run on his end and how it's configured.

## 999. DAT on Falcon?

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: pettert@notam.uio.no
Message-ID: <5blmdd$q30@ratatosk.uio.no>
Source record: 129931

I have been given an Archive Maynard 2000 DAT player - an internal SCSI device and I'd like to use it for backup purposes on my Falcon.

Does anyone know if some software exists for controlling the thing? I know there's a program from Soundpool called DataDat, but I'm not sure if this will do the job.

I'd also like to know if it's possible to use it for playing and recording audio stuff. There are some (very small) connector plugs on it, but none that looks like audioconnections.

Thanx Gary,

But how do you stop it?

If it happens on a page it does it on every 'connecting to host' which
means it could be 10-20 times for one page :-(

This means you can't leave the computer to downoad the page 'cos this stops
the loading :-(

It is a real pain, please tell me what to try to stop it :-)

Yours Roy

> >Merci.
> >
> >Pierre-Yves.

No way, I'd say. I'd guess the PPPkit uses it's own proprietary=20
programming interface, while Newsie uses the STiK interface. If you can't=
=20
have plain, uncompressed slip from your ISP, you must go for MiNTnet and=20
use GlueSTiK, right now that's the only way to use Newsie on a PPP=20
connection.

Cheers Peter

# 1003. Re: Notator for TT 030?

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: "Dr. Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <E441z4.H7K@cf.ac.uk>
Source record: 129935

I know its possible to run it with the Log3 interface, as a copy of notator is supplied with logic. I'm not sure though if the standard version does, but the only problem I can forsee is the timing of the TT cartridge port for the dongle. Certainly cubase had this problem and a special dongle for the TT was required.

Simon

An easier way to get the SLM to be quiet but still switch-on is to open the lid. That&#65533;s make an interrupt in the interlocking chain for personal security.
Now, find one of the microswitches in this chain. Add your own manual switch in series with this interlocking chain and mount it on the front panel!

That&#65533;s it! For less than &#65533;2

/Christer

# 1008. CD Drives For The Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: Ignotowski <mmcgow1@tiger.towson.edu>
Message-ID: <Pine.SGI.3.93.970116123144.13997C-100000@tiger.towson.edu>
Source record: 129940

Hi, I own an Atari Falcon 030. I've pretty much only found been using it for a terminal the past few years now as I've been working on the PC platform more and more.

I'm no longer up-to-date with what my Falcon can do and what's available for it anymore. I need some information from anyone who might be able to help me out.

I'm planning on buying a writable CD ROM drive with a SCSI-2 interface. Now this would directly connect to the Falcon...correct?

My intentions for the CD ROM drive is to make copies of my audio CDs. I DJ and I need to consolidate some of CDs by cutting out the songs I don't play. Is this possible on the Falcon? What software is out there that would allow me to do this? How much would the software run me?

Any help would be greatly appreciated. I'd prefer E-mail responses if possible. Thanks,

Mark

Hi,

Am getting an ST at the weekend (without a monitor). Can someone advise me on the VDU connections for such a computer? Do they have TV tuners, VGA, phono, etc?

Thanks,
--
You have received this grammatically-correct message from:
Marc Fotheringham, (i96mf@tay.ac.uk)
in Dundee, Scotland.

If you're offended by the truth, then you probably shouldn't visit the Homepage at http://www.virtual-pc.com/room101/index.html

# 1011. OASIS V2.10 & V2.05

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: denr@denr.demon.co.uk
Message-ID: <970116Z165056.520denr@denr.demon.co.uk>
Source record: 129943

I am new to Internet etc

I have an Atari 1040STFM with 4mb Ram, 350 mb Hard Disk and use TOS v1.02

I have been attempting to set up Oasis v2.05 but:

I can't open "group details"

System hangs on "quit"

From the news letters I have seen it appears that file "tools.cfg"
has to be correctly set up.

The only problem is that "tools.cfg" is included in the oasis2.txt
file list, but it wasn't downloaded.

Should file TOOLS.CFG come with download, or does Oasis create it, or do
I create it?!

Where, OH WHERE!, may I download Oasis v2.10 from?!

ftp.demon.co.uk hasn't got it and ftp.cnam.fr has only a partial
oasis210.tos file plus upd_210.tos.

I've downloaded the update file for Oasis v2.10 and naturally I'm
not getting very far because of my v2.05 problems.

I haven't yet mastered the WEB so I can't try there!

This 53yr old would be dog paddler would appreciate any help, advice etc.
going.

I have been advised to forget Oasis V2, but I am a glutton for punishment!

It's a class C network, 256 addresses.

> Such addresses are reserved for local area networks, and if the LAN is
> connected to the Internet, and by error a paquet goes out with such an
> address, it will not do any harm as it will not be routed...

The latter is something only you believe !

Two things :

a) If I remember right then the wording of the original message was such
that the author would use a randomly chosen address, not necessarily one
of those "free" addresses.

b) To all those people advocating use of the "free" addresses 10.a.b.c or
192.68.0.x : Are you aware of the fact that datagrams with those
addresses not only must not be routed to the open Internet, but Hosts
with such addresses should not even be *connected* to the Internet ?
Have you ever read RFC1627, labeled "Network 10 considered harmful" ?

Cheers Peter

> Was the TOS version upgraded as well?

I've experienced this problem also.

If the game is not auto booting, you can use one of the the memory setting
programs, like MEMSET.PRG. This will allow you to temporarily set the ST's
max memory back to 1 meg.

If the game is autobooting, there might be problems, but you should be
still able to load up MEMSET, then insert the game disk before selecting
the 1 meg option & allowing the ST to restart.

Sounds like the old "drawing below the screen" bug.
You can't do that (dawing below the screen) on 4Mb ST because the
screen memory is located in the highest available memory. And if you
draw below the screen you will end up writing outside the memory. That
is OK if you have less than 4Mb memory. But if you have 4Mb memory
the atari will hang. Beware!

I have used All 3 PPP's and the Slip protocols without any problems.We
still do get the message bad packet after it connects but that's where
it stops.When you say version 2.1 do you mean 2.10 ? They are
completly different versions. I agree that the program needs to be
made a lot simpler to install . I would only put a spot for your logon
and password,mail,news and IP address and Protocol . The program
should do the rest .

I had this problem with a MagiC 4 upgrade. Are you, perchance,
using an ST with TOS 1.02? I was... and my brothers STE (1.62)
installs MagiC 4 perfectly. Mine only works if I start *A*
version of MagiC first - perhaps you should try and either:

a) get hold of an old version of MagiC.
b) run MiNT/FreeMiNT on your computer and try from there.

I couldn't decide exactly what was going wrong, but it worked
eventually. Persist - it's a very good OS; I just upgraded to
MagiC 5 (which in some ways I regret - the floppy disk access
just isn't as fast as in previous versions - but it does have
multithreading, virtual file systems etc..., and supports
more MiNT system calls than before).

# 1020. Editor for Speedo fonts?

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: dipching@ping.be
Message-ID: <853445422_OASIS_@ping.be>
Source record: 129952

Does anyone know about an editor for speedo fonts ?
Could anyone explain how it is possible to get two characters one
above the other? (Actually when you type the second one, it appears
just above the first one, I saw that in a tibetan true type font).

Mega STE, TOS 2.05, 1.44Mb Floppy, 80MB HD, great condition. Includes keyboard, mouse, power cable, manual. Whatever happens to be on my HD.

SF354 SS external drive, like new

SM124 monochrome, no high voltage (parts special)

SC1224 Color, works very nicely.

Spectre GCR 3.0, with ROMs, with all original software.

KCS Omega

Dr. T's Copyist DTP

Oktal Multi 1.1

Boxes full of games.

Make offer on all or any of above. Feel free to ask questions. I'm located in Warren, MI and would like to sell the heavy stuff locally, but will ship if no local interest is generated.

-Dan

You just contradicted yourself here.

Although Linux is quite a bit more intellegent about it's VM,
you will still take a performance hit if you depend upon it too
much; Linux developers admit as much. On the less robust systems,
this situation is magnified.

I assume that all you have to do is send the binary file out of the serial
port to the programmer from a terminal program??

td> 3) I use STeno as an accessory, and send text to STalker without
td> saving it to disk. I would sure like to have the same facility with
td> PageSTream - an accessory (it wouldn't have to be STeno) text editor

td> not a text editor?

This is possible, take a look at extakey.acc, you can send a string (albeit
only a short one) from it to an open window in Pagestream.

Normally tho' the Atari clipboard would be used for this sort of thing,
although it does involve writing to disk of course.

## 1026. Problems downloading ".TOS" files via WWW (Lynx)

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32ddad1e32f778a@sn.no>
Source record: 129958

I just downloaded a couple of .TOS files from a web page, using Lynx, and when I tried to run/de-compress them nothing happened, so apparently there has been some problems with the downloading...

I seem to recall Lynx saying "text" while displaying the download format, which is ofcourse wrong for a binary file.
Is there anything I can do to set up Lynx to handle these files correctly, or does the person at the other end (the web page owner) have to change something (and what?- in case I contact that person with suggestions)?

Very few games have a problem running on anything more than 1Mb on a ST, because they were programmed to run "exactly" om 1Mb machines instead of more than 512K. Cybernetix and Monkey Island are prime examples.

There is a thing called MAKE1MB.PRG that will fool your 4Mb ST into being 1Mb and I use this for running Cybernetix. Should be on most FTP sites, but if you need it I'll send it toyou through e-mail. Hope this helps...

Following on, but with a twist: Is there a piece of software that will allow me to write ST disk images (such as the MSA type) on a PC. ie. Is there a version of the MSA software for PC's? The reason being that I've acquired an ST at University, but all my old ST stuff is back home.

Yes, I did this and I was unable to format any floppy disks. I went and ordered a new floppy drive, only to find out later that everything worked fine as long as I left the ASCI drive turned on. This is with a TT with internal SCSI. I don't know about any other errors, but this was enough to convince me to leave the ASCI on at all times.

>a CD ROM and watch MacOS on a PPC slowly draw the contents of that
>window.

Yep. Solely because of the Finder's methods for getting the icons for the
files. The benefit of that approach is that every file can have its own
icon, and you never have to (as a user) assign icons to file types.

>Atari programmers on the other hand, do it for the love of the machine
>and enjoy the satisfaction of achieving great things from small code.

That's a bigoted attitude to take. You really think all non-Atari
programmers are corporate automatons? I can assure you that if you look,
there are plenty of lean&mean programs for any platform, written by people
who do enjoy the satisfaction of code bumming.

>Many Atari programmers work in machine assembly code, a corporate no-no
>in the Mac and PC market.

Assembly is hardly a "corporate no-no". There are tons of commercial
programs which use it.

Writing programs entirely in assembly is out, though. There's no purpose
in it, no matter what the assembly fanatics tell you. There are classic
rules of thumb for writing good code; one of them is that your program
will spend 90% of its CPU time in 10% of the code. Speeding up that 10%
with assembly is very desirable. The rest of the program? If you rewrite
it entirely in assembly you will achieve *very* little benefit.

glen varley wrote:
>
> Does anyone still play st games? If so,what do you play?

Hi Glen,

Well, the old STe has been put out to pasture until I can afford to have it repaired - when it died in January last year I was forced to migrate to (okay, okay) PC to keep up with advances in Steinberg's Cubase Score MIDI and Audio Recording software.

At the time of it's death, R-Type and Afterburner were the favourite Atari games for both myself and my girlfriend's brother. Many happy hours have been spend on wet weekend afternoons, munching on cornchips and salsa, and blasting one another to bits in Afterburner to calls of "Cruise, Cruise!" (as in Tom Cruise in the movie Top Gun)!

I also have a fondness for a quirky German-language shareware version of Solitaire which I bought for the STe.

When I resurrect the ol' dear, I will press it back into service as a MIDI data filer. Interestingly, for all the PC software bits around, I still can't find a PC routine to save MIDI System Exclusive dumps as effectively as the one I have for the Atari! (Didn't I read on this 'group a few weeks back, trivia to the effect that Atari translates to "winner" in the Japanese?) *Atari wins again!*

Cheers,
Murray.

PS: I'd like to congratulate all contributors to this 'group on their healthy and thriving little community. If I'd have known such support and resources were available to ST lovers, I'd have gotten on the 'Net much sooner than I did...

# 1038. How Fast is your Falcon SCSI?

Newsgroup: comp.sys.atari.st
Date: 1997-01-16 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <5bk3rd$6k2@news.Hawaii.Edu>
Source record: 130016
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings,

As I am experiencing disappointment with the performance of my new
A/V SCSI drive, I was wondering what kinds of data transfer rates others
of you are getting as indicated by ICD RATEHD.

My drives perform as follows:

Quantum 540meg SCSI drive 1700k/sec
Seagate 1.2gig IDE drive 1900k/sec
Seagate 4gig SCSI Wide drive 1400k/sec (Eeek!)

Specs say the Seagate 4gig will do 20meg/sec, I estimated 5-10meg/sec in
that I'm not connected to the Wide data lines. 1.4meg/sec I just can't
understand.

Any ideas regarding the maximum data transfer rate that the Falcon SCSI-II
port can handle?

>decent VT-100). It is _not_ really hard to set up. But is powerfull
>enough to give pretty good results.

I second that! I've been using Connect for a few years now and I certainly
have no intention of going over to another terminal emulator.

It's got loads of useful and handy functions (the online counter to name a
few, which in addition to showing online time also shows you how much money
you've spent online and when the current phone unit is about to elapse!).
Actually I haven't seen any terminal emulator on any platform that can
compete with it.
As for being hard to set up- I had problems with it in the beginning, but
that was because I had just about no knowledge about modems and telecom
software to start with. But I did get a lot of help from this newsgroup, so
once you get the program set up properly it's not too hard to get used to.

>> Is there a "find file" program similar to that on a Mac for the ST which
>> will search mounted volumes for the selected file, show you the path to

TOS 2.06 and above does provide a search function which locates files of highlighted partition. It will open a window highlighting the file found and ask if you want to continue to search for another.

If you're using < TOS 2.06, then I suggest you try to find a find file utility from the FTP sites. There are several including Jet Find and Fsearch. Fsearch not only finds files but also does grep.

Yes, it is. The SCSI transfer speed of TT and Falcon is limited by their
DMA chip. Their seems no way to lift this limit by additional hardware.

Uhum, excuse me but a century year that is divisible by 400 is leap year. 2000 / 400 = 5. Last year was a leap year. 1996 + 4 = 2000. The year 2000 is a leap year.

m>
m> Does anyone know what Atari/TOS software is suitable for this scanner
m> and where such software can be obtained?

The original progs I got were XP_IT_HI.PRG and XP_IT_LO.ORG - both of them
particularly horrible bits of work tbh, but they got an IMG scanned for
tidying up in something (anything) better.

I don't know the legitimacy of this, but I could UUE it to you if you like.
Copyright or not, it's useless for any other purpose.

You can get it at ftp.demon.co.uk in the directory /pub/atari/oasis !
It's version 2.10 and you should have no problems running it with 4
megs on your 1040 STFM . The Tools file comes with the program but you
better take a look at it to make sure it's pointing to the right
programs and drives you have them in . Goodluck !

I beleive the word I used was "unused" or something of that nature. Either way, what I was meaning was one of the addresses reserved for use outside of the Internet.

>b) To all those people advocating use of the "free" addresses 10.a.b.c or
> 192.68.0.x : Are you aware of the fact that datagrams with those
> addresses not only must not be routed to the open Internet, but Hosts
> with such addresses should not even be *connected* to the Internet ?
> Have you ever read RFC1627, labeled "Network 10 considered harmful" ?

Oh. Something made me think that the machine could be connected to the internet as long as it did not use the internet with that address. E.g., if I set my computer to 10.1.2.3 and plug it into the internet, but don't actually send any packets with it, how can it harm anything?

Either way, it seems that you are right in saying that the machine may not even be connected to the internet. In that case, it would be necessary to obtain two IP addresses, one for the machine you actually want to use, and one for the intermediate machine (in answer to the original query which started this thread).

On my 100MHz Pentium, opening a folder in the explorer (WinNT4) takes several seconds as the OS needs to open every application to retrieve the icons for that file. If I smaller icon, it's faster as the rendering is faster. On my Falc, it's faster as it don't have to open every application to read the icon.

Hi!

I am an old Atari aficionado from the old 8-bit days (still think that old hardware had style!) I have been 'out of the loop' for several years, and have been reading here on the newsgroup about an Atari Falcon? What is it, and what OS does it run? Is it portable, or expandable? Any information would be greatly appreciated, as I feel that Atari have always made a great product.

Thank you!

Ron Tavalin

# 1056. Mutlisync Monitors on ST's

Newsgroup: comp.sys.atari.st
Date: 1997-01-17 00:00:00 UTC
From: Dennis McGuire <mcguired@moose.erie.net>
Message-ID: <Pine.LNX.3.95.970117140444.4508B-100000@moose.erie.net>
Source record: 129834

Is there any one out there who claims to be an expert on Atari ST
video output?

I have a Loop multisync monitor which I bought from a friend to
use on my ST. He used it on his ST for a number of years with a
mono/color switchbox which he bought with the monitor. So whether it will
work with an ST is not at question. When I bought it from him he was
using it daily on his STe and he also connected it up to a 520 ST. It
worked fine in both color and mono on both of his computers.

When I got it home, it wouldn't work on my Mega STe! So, I tried
it on a 1040 ST, and a 1040 STe and it won't get a picture in either color
or mono! I presume that this is because it is not syncing since the
screen stays black. I checked all connections and disassembled the cable
to look for faults. No problems. I took the monitor back to his house
and it worked fine on his computers again!

Is there something in the Atari video circuitry that can explain
this or am I just cursed???!!!

On 15 Jan 1997, Theodore L Hopman wrote:

> Any multisync monitor that can sync down to frequencies of ~15 kHz should

: >problems:

Give CoNnect a try...
It's around 60DM to register, and worth every penny...
The Demo version isn't very crippled so you can definately get
a good idea of how great this terminal is! I'm pretty sure you'll
need at least a 1meg machine to run this (could be wrong, does it work in
512k?). Comes in several languages including English.
Everything runs inside windows which is GREAT if you multi-task...supports
loads of terminals and protocols, supports all known serial ports (with
HSMODEM drivers installed). Runs in ST medium and higher resolutions
...voice mail...and much, much more.

Can be found at most atari ftp sites...one from the top of my head...
ftp://ftp.toad.net/umich/etc...
(this is a mirror of atari.archive.umich.edu)

## 1060. Where can I get...

Newsgroup: comp.sys.atari.st
Date: 1997-01-17 00:00:00 UTC
From: Richard Wegner <richardw@dmapub.dma.org>
Message-ID: <Pine.SV4.3.91.970117141932.1719A-100000@dmapub.dma.org>
Source record: 129838

Does ANYONE know where I can get the blue prints (schematics(sp?)) for the Atari SLM804 Lazer Printer...I have one and I really need them.

REASON: I have an Atari 1040STe with a 100 meg hard drive and a CD Rom Drive unit attached. The dma cable is attached to the interface for the SLM804, which is in turn plugged into the printer and then the other part goes to the hard drive then the CD Rom drive. The hard drive and the CD Rom drive work perfectly well, but my SLM804 doesn't work. The light indicator on the printer is still a red circle. I don't understand what happened, because it used to work perfectly fine. All I do know is that it worked until my dad opened it up and looked and found out that it still had toner and a drum in it. Now it won't work. My dad is one who does know how to fix computers (he does it for a living) so it shouldn't be too difficult. ANY HELP WOULD BE MUCH APPRECIATED! Please respond ASAP! I would like to use my printer sometime...Also, if possible, I would like a person in the USA to help out or someone who knows someone here in the USA that could help out because of overseas shipping.

Thanks and send any replies to my e-mail address.

Ah, didn't know, that's why I guessed. In that case the guy only needs
GlueSTiK.

Cheers Peter

# 1062. Newbie needs help getting started!

Newsgroup: comp.sys.atari.st
Date: 1997-01-17 00:00:00 UTC
From: Brian Hutchinson <hutch@ena-east.ericsson.se>
Message-ID: <32DFDFE5.41C67EA6@ena-east.ericsson.se>
Source record: 129840

Hello,

I'm very new to TOS and never had an ST to learn about it and GEM, ACCs, control pannels, .APP files and .TOS files etc.

I now have a Falcon 030/14M RAM, 85M IDE, and two 420M SCSI-I drives with NO MANUAL!

I have checked out the Net and I can't find anything that would give a newbie like me an intro to ST, Falcon, TT or anything (ex: file systems, how to boot from floppy, change from 16Mhz to 8Mhz etc.) I started out with the 600 & 800XL 15 years ago but I never got a 16 bit machine.

I have read the FAQs and they don't address the above areas. I know where to get all of the
files but don't know what I need!

I have the following questions:

If I hose something up, how would I go about re-formatting/partitioning my hard disk? The reason I ask this is because I am interested in getting mint, linux 68k, or MultiTOS.

If I go with Linux can I dual boot? Can I start up Linux at will and still be able to run TOS apps?

Do I have to make a boot disk for TOS in case I crash my HD. I don't even know how to boot from a floppy! :-(

What is the best way to backup the files on my Falcon? Do I need to get a Jaz drive or would a SCSI tape be better? What ever I get I will want to use it to backup my Falcon & Wintel brick.

Thank you for the information. I plan to do great and wonderful things with my Falcon as soon as I figure out how to do some things with it. I love this machine, I wish I would have gotten one sooner!

Brian

# 1063. What's the best HW upgrade for Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-01-17 00:00:00 UTC
From: Brian Hutchinson <hutch@ena-east.ericsson.se>
Message-ID: <32DFE1F3.167EB0E7@ena-east.ericsson.se>
Source record: 129841

I've seen a few messages on the news group about BlowUP FX,
Afterburnner 040 and a Nemisis or something like that.

What is the best upgrade for the Falcon? I'd like to get or
be directed to some information so I can check these upgrades
out.

I would also like to hear from anyone who has these upgrades
to evaluate personal testimony regarding speed, price, and
compatibility.

I want to get a 882 FPU so I can run Linux (I know about the
kernel with emulation) faster but I don't want to spend
50 or 60 bux on it when the upgrade I'm interested will
probably have one anyway.

Please post to this news group so others can get the info
too (you can cc me if you want I don't mind)

Thanks again for the help. This group is Great!

Brian

Several such programs exist, I believe Parafin is a popular one.

In order to launch programs from it, however, you will need an AV-Server.
I recommend Thing.

# 1068. Falcon IDE partition curruption

Newsgroup: comp.sys.atari.st
Date: 1997-01-17 00:00:00 UTC
From: dbeards@f1.net.au
Message-ID: <5boqs8$d7v@zonk.geko.net.au>
Source record: 129846

Hi All,
After recently suffering a partition crash on my internal Falcon IDe
drive, I ordered Diamond Edge 2 to fix it. However it won't even
recognise the drive, with the message 'unrecognisable' boot sector'.
I've given up hope of repairing the data, I just want to be able to
use the partition again. I use HD Driver v6.
Any help?
Thanks,
Dave B.

Some time in 1972, I believe.

Oh, incidentally, Don's article (Did Anyone Say Goodbye?) appeared a couple of months ago in Next Generation, a video games oriented magazine. The month before or after they also ran an article on the history of Atari, whether the idea for Pong was stolen from Magnavox, etc. This month's issue has a section on myths/truths about classic video games. Well worth checking out...

# 1070. LZH decompression problems. Help please

Newsgroup: comp.sys.atari.st

I could be wrong (it's happened before with embarrassing frequency!), but I
beleive you must use Diamond Edge 3 or later to do anything with an IDE
drive.

However, if you have given up on the data, why not use HD Driver to simply
repartition the drive?

Leon....

How much RAM are you using Leon? I have a TT with 36megs of RAM and generally have 50 fonts loaded all the time. It doesn't "moan" for me and I can add fonts on the fly as I need them. Talk about quick, with NVDI 4 and Magic 5, it flies!!! Papyrus 4 also loads and prints colour JPeg, TIF, TGA and GIF files too. I like it a bunch! I have to admit I limit the fonts on my Mega 2 and my Stacy 4 because I have to drive the SLM605 but Papyrus is very good even there!

Hey Augeus - by the used Papyrus - you'll like it too!

I have tried two networking programs to connect my TT and Mega STe
through the LAN ports. One was Duet. It didn't work at all, but I have
used it successfully though the MIDI ports. I don't recall the other
program, but it didn't work either.

Dumb question: Why is connecting through the LAN port so
difficult? It's basically just another serial port, isn't it?

I've used LittleNet and MediumNet for years without problems
through the MIDI ports. I use it primarily for porting files from the BBS
computer to my personal system. It would be nice if I could take
advantage of the speed of the LAN port.

> not :-)
OK, this sounds terribly arrogant, but both those virus killers you're using
are ancient. I am not saying that my Ultimate Virus Killer is better, but fact
is that you should only use a virus killer program that is no older than about
6 months (and preferably even no older than 3). Volker "Virendetektor" Soehnitz
seems to have given up on supporting the program a long time ago (the version
you have is from March 1993), and Poison, well, I haven't heard something from
Bernhard Artz either, for a long time (and the version you're using is from
September 1994).
You will find UVK 6.9 (and up) coping with these latest viruses. The Carpe Diem
thing, by the way, is not packed at all. It is a virus header followed by a
compressed version of what appears to be a 98 Kb "Dentro" (a demo for Falcon).
This dentro does not work and was only tagged on to make the file larger and
the claim of it being a "Falcon enhanced game" more credible.

>Perhaps I read too much into your comment, then.

I think that there is way too much emotional attachment to silly pieces
of silicon and plastic. We could all take a lesson from Mr. Sinclair.

To give you an example. MagiCMac is a complete 32 bit preemptive
multitasking
OS with memory protection, threads, signals, pipes etc. etc. etc. for
the Mac
it is shipped on a single 1.44 MB floppy complete with a really slick
desktop
called Ease which I prefer hands down to the Mac Finder. It is faster
and more
stable actually.

Sure, MagiCmac does not have some of the other features (of which value
is
debateable) of MacOS.

An excellent example of what can be achieved when the time and energy is
put
into it.

>Exactly. And even so, with the use of the 90/10 model I detailed, you
>could get programs that ran just as fast, but were far easier to write and
>maintain.

Not being a programmer, I cannot really debate this with any authority. Others
will have to do that for me. All I know is that Papyrus under MagiCMac on my
Mac outperforms Word perf 3.5 on the same Mac. Faster loading, faster scrolling
etc., and yes I agree WP 3.5 on the Mac is very fast ... for Mac word pro's.

All the best,
Chris @ Computer Direct

When he first made the post I commented that to utilize Diamond Edge
properly, you have to prepare a restore disk before problems occur
for best performance. It's not much use after the data has been damaged
except for recovering files that have been accidently deleted and have
not yet been overwritten. It sounds like he wants to save the other
partitions however.......with luck.....and a weeks work or so....
Probably best to suffer the loss and just do as you say.

I use the older LHARC.TTP. It works fine with drag and drop
or as an installed application.

Try getting Stewert v1.04e... adds a menu bar clock, spinning dialogs, an
icon in the top-right that changes with the foreground app and much more :)

I like it!

> started this thread).

If you can get another IP address from your ISP then that's certainly the way to go. With those "unused" addresses you can connect if the machine with the proper IP address can do IP masquerading. But you'd still have addressing problems, if you want to communicate from Intra- to Internet or vice versa. However, there is no TCP/IP stack for Ataris yet that can do this. But, who knows, maybe one day we'll build it into STiK ? ;-)

It appears that you were using a different cable/switchbox at home and at
your friend's place. If that is in fact the case, try it again with that
switchbox on your system(s). I suspect the cable.

OTOH, if it's the same one...

Yes, I always do that. Usually Lynx also alerts me if I don't do it, by
telling me that "this file can only be downloaded", or something like that.
But..... I did manage to solve the problem I think!!!!

Someone in a UNIX group suggested that I make a text file called:
.mime.types (residing in the root of my home directory).
This file looks like this for me:

```
# mime.types
application/octet-stream lzh LZH tos TOS
# eof
```

Pretty simple actually- but it works!

>On the author's end, if he's providing many .TOS files, he should
>arrange for the server on his end to recognize these files as binary
>files and flag them accordingly, probably with a content type of
>application/octet-stream. Exactly how he would go about doing that
>depends on what server is being run on his end and how it's configured.

Thanks. I'll keep that in mind when I talk to the owner of the particular
web page.

> MSTe.

I've owned one (Mega ST, that is) from 1990. It's still sitting downstairs
in the garage, packed away in boxes.

I haven't seen a real Mega STE keyboard - all the systems I see are with
the original keyboard, so I'd assumed that the original keyboard was also
shipped with the MSTE.

(perhaps NZ had somehow offended the great keyboard gods, and were
therefore banished from the real good keyboards?)

> Do you have the phone-jack type of connections at both ends of the keyboard
> lead? I think that's the only difference. Mine only has one at the computer
> end B^{<

The keyboard-to-computer cable is fixed into the TT keyboard, and has a
phone-line plug on the other end.

However, the MegaST keyboard had a detatchable (and losable) cable with a
plug on each end to connect keyboard and system unit. And the supplied one
was a tad short.

(BTW: This discussion should really be taking place in the "Keyboards"
thread, as there has been 100% drift from the original topic of this thread)

Hi!!!

I am looking for the following:
dssd 3.5 Floppy drives
dsdd 3.5 Floppy drives

Any of the older hard drives for the Atari 520 St, 20-30 Mbyte
will be fine.

Thanks!

Bigotted? How so. My comment was made in reference to the "Corporate"
programming companies, not individual code hackers. Without naming any
specific "Corporations", I think you should be able to figure out to
whom I reference this point to.

Surely there are hobbyists and small guys programming in their basement
that do a wonderful job on software for all platforms. You just don't
see their stuff in the stores or in the catalogues etc. because it is
mostly PD/Shareware.

>>Many Atari programmers work in machine assembly code, a corporate no-no
>>in the Mac and PC market.
>
>Assembly is hardly a "corporate no-no". There are tons of commercial
>programs which use it.

Corporations are more concerned about getting their product onto the street
on time and on budget, no time for optimizing.

The fact that simple apps come on multiple disks or CD's is a testament to
this when compared to relatively similar apps written in tighter code.

>Writing programs entirely in assembly is out, though. There's no purpose

It is "out" in the Mac and Win world because it takes too long, it is easier
to use higher level languages. In the Atari world, it is "in" because a highly
optimised app (or OS in the case of MagiC) can be run with decent speed on 9
year old equipment.

All the best,
Chris @ Computer Direct

Centurion Ministries

Centurion Ministries is a Christian Ministry enabling evangelical Christians and familes, to use and own computers.

We receive donated computers and equipment, ensure that they are workable, and then pass them on, according to a waiting list.

We are looking for IBM systems and peripherals, any ones will do. As well as some of the classic systems, TI-99/4A, Apple II, Commodore, Amiga, and Atari ST.

Centurion Ministries is a legitemate Ministry, subject to, and under the authority of the Elder's Board of El Shaddai Christian Fellowship Church. As such, all donations can be used as a Tax-Write-Off.

We are always in the need for computers and equipment. Please contact via email: ab453@cleveland.freenet.edu
if you have any equipment to donate.

Thanks for your time! Take care and God Bless!

Regards,

James Walter Krych

p.s. This is a USA based ministry.

Actually, if a GPF occured, my experience tells me to better shutdown and reboot the system. This is because there is already some corruption in the memory. I encountered several times after a GPF, everything looks OK but program which are stable (eg print manager) will themselves encounter GPF.

> this situation is magnified.

Obviously more physical memory not more virtual memory makes your computer faster. VM does not slow a machine much as long as you don't "depend on it too much" as you say and cause the hard disk to be thrashed to pieces. Just the extra VM layer shouldn't slow things down too much - lookups must be done to ensure memory protection anyway - particularly as it can be very helpful.

Most systems do not take kindly to running short of memory. Running a computer slightly slower all the time and not crashing is IMHO better than running it slightly faster and then getting _bad_ crashes (i.e. disk corruption and/or reboot) when Netscape messes up and gobbles up loads of memory. Or when you're compiling Modula-3 programs (why I needed the extra

MB :)

Try Gemar - it was in German last time I looked, but it was very good the one time I had access to a DAT drive - (un)fortunately I havn't had need to test the "restore" part properly, although it seemed to work fine on a small directory I tried.

Use a utility in the MagiC environment (the Mac key combo won't work)

I use Imagecopy, it works nice.

There are PD/Shareware utilities on FTP sites to do this as well.

All the best,

Hi All

Original message from Stephen F Barszczak:

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
The 2nd Meeting of the White Rose Atari Group will be held on the 22nd of
January 97 at 8.00pm. We will all be meeting at the Elephant & Castle on
Great Horton Road Bradford, which is opposite Cannon Mills in Bradford.

After a brief introduction of any new members we will then depart to the
Basement flat at 107 Cecil Avenue off Great Horton Road, where a room has
been made available for members who may bring their computers and connect up
to TVs/monitors that are made available. Also available will be a Falcon and
other ST's including a printer.

Hopefully I will also be able to talk Paul Simmonds into demonstrating Quick
BBS STE which he is in the process of updating.

If anyone would like further information about the meeting they can telephone
01274 826353 or leave a message on the >TGM< BBS 01274 787361 or EMail Paul
Simmonds on paul@tgm.legend.co.uk

# 1104. Monitors - NEC 5D

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: please@no.spam.mail.here
Message-ID: <26752_please@no.spam.mail.here>
Source record: 129769

I've recently been offered an NEC 5D monitor for a very good price and am wondering whether to have it.

My question is will this monitor work on the STFM/Falcon in Colour/RGB modes. Does anyone know the sync rate this monitor can handle?

NEC's website only mentions their current range of monitors and I couldn't find any information on the 5D on the web.

You see the current owner is running an old 486sx25 on it using a VGA card and has bought a new PC which includes a 15" SVGA monitor which he is pleased with (smaller and takes less room) so is interested in getting rid of the bulky 5D ASAP and if it can handle the lower rates I will snap it up to run my Falcon/STFM on.

All help appreciated.

PT> purposes on my Falcon.
PT>
PT> Does anyone know if some software exists for controlling the
PT> thing? I know there's a program from Soundpool called DataDat,
PT> but I'm not sure if this will do the job.

Hi Petter,
DataDat from SoundPool gives you possibility to make backups to a regular
DAT-recorder, via an S/Pdif-interface (that is, if the DAT has digital in/out).
If you have a SCSI DAT-streamer, you should use Diamond Back instead. I haven't
tried the streamer you mentioned, but a Conner/Seagate 2/4GB SCSI DAT worked
perfectly when I tested it.
PT> I'd also like to know if it's possible to use it for playing
PT> and recording audio stuff. There are some (very small)
PT> connector plugs on it, but none that looks like
PT> audioconnections.

Sorry to disappoint you, but very few DAT streamers can be used as audio-DAT
players/recorders. The ones that can be used as both are so expensive that
practcally noone can afford them (it would be much cheaper to buy both separate
units instead)...

Best regards,

Claes

Ignotowski wrote this to All about CD Drives For The Falcon:
I> I'm planning on buying a writable CD ROM drive with a SCSI-2
I> interface. Now this would directly connect to the
I> Falcon...correct?

Yep, as the Falcon has a built-in SCSI-II connector.

I> My intentions for the CD ROM drive is to make copies of my
I> audio CDs. I DJ and I need to consolidate some of CDs by
I> cutting out the songs I don't play. Is this possible on the
I> Falcon?

It's possible, but there are some things to think about:
First of all, to be able to use a CD-ROM as a player, you need CD-tools or ExtenDos Pro.
If you simply want to transfer the songs onto the HD, it can be done with the help of CD-tools (I don't know if ExtenDos supports audiotransfer via SCSI), and a CD-ROM player that's compatible with this rare function. Toshiba are compatible for sure, but most others aren't. The problem is that you want to take songs from different CD's and make your own mixture instead (have you thought about the legal aspects of this?). This means you need a HD that's large enough to hold all the data for a CD, which is about 700MB. This means that you need a CD-ROM player, a SCSI HD of about 700MB, as well as the CD-writer.
Another way to go is if you use a HD-recording program and record the songs one by one to the HD from a regular CD-player. If the program can use sn S/Pdif interface (Cubase Audio, AudioTracker, Quincy...), you can use either optical or coaxial transfer and won't get any signal loss. Otherwise, you have to go via the standard audio input, which means extra noise and less sound quality...

I> What software is out there that would allow me to do
I> this? How much would the software run me?

The software to run the CD-writer is CDRecorder2.0 from SoundPool, which for the moment supports the following recorders:
Grundig CDR100IPW; HP 4020; Kodak PCD225; Philips CDD522, CDD2000, CDD2600; Plasmon RF4100, RF4200; Yamaha CDR100, CDR102.
CDRecorder writes audio only as "Disc-at-once", which means that you can't write one song at a time, but have to write the whole CD at once. The reason for this is that only disk-at-once is certain to be compatile with ALL audio CD-players, as well as the only way to be able to write complete master CD's for mass-duplication.
The price for CDRecorder2.0 here in Sweden is SKR2495. Check the exchange rate and I believe you'll get close to the price where you live...

Best regards,

Claes

# 1108. CAB is killing me!! Please HELP!

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: dooley@infomatch.com
Message-ID: <5bpsl5$4et$1@berlin.infomatch.com>
Source record: 129773

Ok.. I'm having a hell of a time getting cab to run!
STiK is setup properly as I can use AtarIRC and other external prgs.
But CAB will not work! With CAB 1.31 I keep getting a F:\WWW\CACHE error
I guess it can't locate the CACHE folder.. and YES I did set CACHE path
in the CAB 'OPTIONS' menu.

And with CAB 1.5 I can load it up fine and then when I click on URL I get
3 bombs!

I have a 1040STe, 4megs, 80meg h/d, HSModem6.

I'm using hardly anything in the AUTO folder so nothing will conflict..
I read the docs a hundred times over.. I don't think I'm doing anything
wrong? I even Re-InSTalled it quite a few times.. and even re-did it
with WWW-Installer 1.00 but to no avail!

Please help me outta CAB HELL!!!

Please also send Help to my e-mail address! dooley@infomatch.com

Thanks
Johnny

How about an answer for the people who have the Freekeys extension and aren't totally impressed by it? Anywhere in the UK for a new TT keyboard? I know Compo were selling it for ï¿½50 before there went under.

## 1113. ZIP drive and Falcon

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: uq086@freenet.Victoria.BC.CA
Message-ID: <E46oFx.97w@freenet.victoria.bc.ca>
Source record: 129778

I just purchased an Iomega Zip and the outrageously expensive cable but the Falcon will not recognize it upon boot-up. It says that device 0 is not responding, which I understand because the Zip can only be set for device 5 or 6. HDX.prg correctly locates it as device 5. I'm using AHDI and I really don't feel like spending more on driver software if I don't have to. Do I have to or is there some way to get AHDI to see device 5 on boot-up. Any help would be greatly appreciated. Thanks.

# 1114. MagiC 5

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: will@lyneside.demon.co.uk
Message-ID: <853582464_OASIS_@lyneside.demon.co.uk>
Source record: 129779

Hello,

I have just purchased MagiC 5 for my 1040 STE 4Mb and I have problems setting it up. I use Superboot 8.1 boot manager to set up various .prgs .accs which need to be available for different applications. eg. STiK needs a cookie jar extender. Does anyone know the best way to run superboot with MagiC ?

Also I am slightly disappointed with MagiC. It occasionally bombs out and will not run STDATA (Atari's own database program) as it says it does not have enough memory which is ridiculous with 4Mb RAM , no accs loaded, and a bare MagiC desktop. So is there any way to set up the boot sequence to select MagiC or not as I cannot run it all the time ?

I'm beginning to think I have wasted 70 quid. Please could someone reassure me I haven't.

Any help really appreciated.

Cheers,

Will.

I'd rather buy a new disk drive. First of all it'll probably be a lot
easier (and maybe cheaper as well) to get hold of a new one, secondly
you'll get to use DD disks (or even HD if you install the necessary
electronics needed etc.).
Nobody uses single-sided disks any longer, and you'll have a hard time
getting hold of ST software nowadays on SS disks.

And as for the replacement part you mentioned... I dare to say that you can
forget it- it's hard to even get spare parts for *new* disk drives, since
they're cheaper to replace for computer companies than the labour costs to
repair them.

Good luck!

So the problem lies within certain GEM programs then? It's not a bug in my system or setup in some way?
I don't know what you mean by "virtual workstation", but I can remember seeing this phrase in "Hyperpaint" (painting program by Atari)- it's like different "buffers", where you can cut/paste between different images.
And I often seem to get the problem with a "messed up screen" after having run it.

As for Everest's author; I looked up the "readme" file with it, and it doesn't mention any email address, but the following might help:

What a pain!!!

>You can ask to standarize, once for all, to ZIP; is the best.

I agree completely! That's why I decided to standardize my compression for
the files at my FTP site. That way, anyone can download them without any
problems, they can decompress them on just about any platform available,
just about everybody has some kind of ZIP compression/decompression
software...
Even though I do like the "Lharc 3.10" (.LZH compression) program _a lot_
better than "STzip 2.6" I decided to stick to .ZIP since it's more common.

Now, how about upgrading "STZip", or making a newer, better zip program,
with features and ease of use such as "Lharc 3.10"?

Source record: 129784

I'm using a Jaz as my main drive with my Falcon and am very happy with it.

I have ICD Pro drivers.... though I can't be 100% sure that the disk can be set to autoboot as I am actually booting ICD from an otherwise disabled and damaged internal IDE drive.

>From the specs the Falcon's scsi hardware prevents you getting near the potential full transfer speed of the drive. However, from what people say I think you'd get a bit faster performance with HDDRIVER rather than the ICD drivers.

I think HDDRIVER also supports reformat of the initial "Jaz Tools" disk (Mac/PC format.. the idea is you load it in you Mac (or PC) and run an install program which converts it to a full Mac (or PC) disk. I didn't try to reformat mine but suspect it can only be done with ICD software by using the ICD PRO SCSI tool program to send the appropriate scsi command(s) - If you can find out what they are (04H?).

One thing to watch out for when buying extra Jaz cartridges is that I have seen 1/2 Gig cartridges advertised... they just seem suprisingly cheap... and often the retailer don't mention they are half the capacity of the full 1 gig carts.

CD Recorder a program sold by Computer Direct or SoundPool in Germany. Really any Atari dealer could get it. Supports the Yamaha & Phillips drives and probably others too. The program comes in two versions, one that is limited to audio CD's and the other writes all the CDROM formats.

Works with TT's and Falcon's

Well, a hundred or so... It'll be 2102, IIRC... (seconds since 1 Jan 1980
as a 32-bit unsigned integer - standard UNIX format time... same as TOS
file time-stamps...)

> can't deal with the years 2000+, and there are thousands of accounting
> packages running on PCs that store the date with only a 2-digit year.

AIUI, it is not the OS (DOS / Windows95 / TOS / UNIX) that has the problem
- but the software that you use! The system clocks of all of the above
(definately on file time-stamps) doesn't use a year representation at all,
so there will be no problem (for a while).

The problem comes from badly coded software which only stores dates in
databases etc. as a 2 digit year. Unfortunately, one such piece of software
is Cobol (not sure which implementations), a *very* common programming
language for business applications. Thus, any program doing date manipulations
with only 2 digits will fall over.

Anthony

>
>Works with TT's and Falcon's

Hi Rich,

Just to clarify, CD Recorder Pro v2 is a complete package now. It writes
ISO, Atari, DOS, Mixed Mode, CD-DA and Multisession.

The Audio only package was dropped because the vast majority of owners
were wanting to write more than just Audio CD's. It offers a cheap
permanent (well, almost <grin>) backup solution as well.

See http://compdirect.com/soundpool for more info.

All the best,
Chris @ Computer Direct

## 1130. .Mid Files

Yes indeed Parafin is able to launch programs if you've Thing.
It is even better if you've e.g. the N.AES/Thing combination. You can
view pictures, text, etc. IMHO the only minus point of Parafin is
that it's a little bit complicated to use.
BTW: Is Parafin still supported and if so what's the latest version?

On a slightly more serious note, does anyone have an email address of
someone at Netscape (and Microsoft) that is the closest thing tot he
newsreader team because whoever thought that letting you duplicate a
message as HTML in the same post was mental but the person who decided
to enable it as default and make it almost invisible to users needs to
be dragged out into the street and shot!

I have trouble playing about 30% of games on my STe with TOS 2.06.Is there an executable version of an older TOS,like 1.2 or 1.4,that I can run,then use a program like DC bootit so that I can "boot up" with this other TOS? Or do I *have* to get a switchable TOS to do this?Or am I just going to have to buy an old 1040 from someone for games?-Satcom2

Well there is a prog made from atari that will look and redo your
AHDI.SYS file for you, the patch is on several ftp, try CNAM or German
ones..
The name is something like AHDIPATch ..
However, I would highly recommend a good driver, faster, easy to
maintain and "plug and play" for any new drive you might get.
A lot of function for your ZIP drive like password protection etc..
Get Hddriver, it cost 39 US dollars. But well worth it..
On teh other hand Ahdi will work ok, not great, not bug free, but ok.

Err, first it is not a kit. It is a DOC.
2) PPKIT is not Mintos.. It is just a layer of Mintnet.
3) the PPPKIT is not very stable.
4) I've had more problem to install PPPKIT (easy) than the full
mint/mintnet.
5) The PPPKIT is singleTOS.
6) The PPPKIT doesn't have any Daemon capabilities.
So in short there is a point to have an other way to connect his
Atari with PPP protocol.

On Thu, 16 Jan 1997, Mario Becroft wrote:

>decompress these lzh files. Please help me!

No worries, and no need to cross-post messages everywhere ;-)
You should get the latest LZH decompressor for the ST, which is Lharc 3.10.
It's got an excellent GEM interface and is very user-friendly.
As for your existing setup. Either your setup is incorrect, the
lzh201l.ttp doesn't cope with your files for some reason, or (worst of
all); your files haven't been download correctly if you've gotten them off
the net- be sure that you download them in *binary* mode!

You can get Lharc 3.10 from:

ftp://ftp.sn.no/user/hallvart/atari/lharc310.zip (168 Kbytes)

Good luck!

Message-ID: <49427812_000007_OASIS_NEWS@000007-hookup.net>
Source record: 129809

I would get Oasis 2.10 which is the updated version ! You can get the
complete package from ftp.demon.co.uk in the /pub/atari/oasis folder.
In this version I would look at the Tools.CFG file to makesure it's
pointing to the right drives . If you can't get this version to work
then get version 1.35 this was an easy version to install and if you
have a POP mail account then get NOS_POP3.TTP also.

I have a dilemna, which one do you think is the best?
I keep alternating both and can not choose...
What do you think, what are the pros and cons??
Anyway, I would like to thank both authors... THANKS for these!!!

## 1149. Toad-in_the-Hole

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: Mike Marion <mmarion7@ua1ix.ua.edu>
Message-ID: <32E16098.3C64@ua1ix.ua.edu>
Source record: 129814

As I read this recent posting about problems with the products and services from Toad computers, I am reminded why I no longer do business with David and his company. In years past Toad was a very respectable and honest company but as the Atari market shrank and David controlled more and more of the US market he began to think that customers must do business his way or not at all. I no longer do business with David, products may cost more at another supplier (usually not) but I would rather give my money to someone who appreciates my business. Our community is small, we need to help and support one another, Toad only wants to take advantage of the situation, my advice, AVOID TOAD, patronize a supplier that supports the Atari community.

Mike Marion

## 1151. Lynx 2.6

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: hyc@frisky.la.platsol.com
Message-ID: <5bshg1$14eo@frisky.la.platsol.com>
Source record: 129816

Anyone out there using the Lynx text-based web browser? The last version I was using was 2.3.1. I just ported the 2.6rp code; it seems to be working so far. I also had to port ncurses, which was almost more of a problem in itself... If anyone wants these things, drop me a line and I'll put them up somewhere. I also defined the Atari character set for Lynx, but it looks like a smarter approach would be to install an IBM PC font on the Atari and use that instead. Many of the characters are the same between Atari & IBM PC, but several disappeared to make room for the Hebrew characters on the Atari. (Yeehah, how useful. Does anyone ever use those characters? You have to print right-to-left too, eh? Silly...)

# 1155. FS: Atari Computer Goods! More Atari Stock! FREE Catalogs!

Newsgroup: comp.sys.atari.st
Date: 1997-01-18 00:00:00 UTC
From: bensmith@teleport.com
Message-ID: <5bpbjo$non$1@nadine.teleport.com>
Source record: 129866
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got Monitors for your Atari 8 Bit like Commodore CM-141 "Like the Commodore 1802" And Disk Drives for the Atari 8 Bit like Stock 1050 and a 1050 Duplicator Drive for Backing Up Software. Plus I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! And for the Atari ST & newer Computers I've added to my HardWare Catalog Supra Hard Drives, Spectre GCR Mac Emulators and Indus (Future) GT Disk Drives. I've also updated the ST Software Catalogs. Updated and more Software Titles added such as Brand New copies of Ultima V for those of you fanatic Ultima Collectors for the ST & for those who like Battling in Mechanized Combat, their's BattleTech, OGRE & OMEGA! And for those of you with more productive things on your Mind, PrintMaster & PageSTream!

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking. And something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Also, on BSC's Home Page! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Page with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Page. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

>> And the JAZ can do up ( min 3.4 meg/sec- max 6.5meg/sec)
>> If I use Howfast the results are totally different..

I haven't followed this discussion, but I feel I have to add a few things:
The 6.5MB/s transfer with the Jaz can only be reached with a really fast SCSI-controller, which the Falcon doesn't have. According to the technical reference and schematics, the SCSI-bus has a theoretical limit of 2MB/s (which means a little slower in the real world) and if I check my 2.1GB SCSI-disk with Howfast, it shows about 1.9MB/s, when my Quantum Fireball EIDE-disks show about 2.8MB/s... Yes, that's right! the IDE-bus is faster than the SCSI-bus, and the computer was designed that way.
Maybe these speeds can be enhanced when you speed up the bus with an FX-card or a Nemesis or similar?
An explanation of the difference between different test programs is that they probably use different size of blocks to read from the HD. Previously I've used SCSI-tools from Hard&Soft (now I use HDDriver) and they have a speed test program built-in, which checks the speed separately for small and large blocks - and there is a BIG difference sometimes between these values, depending on which HD is tested. I've found that Howfast is the most reliable speed-test for HD's.

Best regards,

Claes

Phil... Print to file in LDW using the *.LDP extension. This creates
an ASCII text file which you can import into Works. You'll have to
reformat once you get to the spreadsheet and import the ASCII text.

Source record: 129678

>Can someone clue me in as to the HD situation with an Atari?
>
>(1) Is that a SCSI port on the back of the thing? Can I use my old SCSI
>external drive from my Mac?

Almost. It's "ACSI" and requires a host adapter for any
non-Atari-brand hard drive. ICD's The Link-2 or Norbert's Link96
would be perfect for usign a Mac drive (The Link-1 won't work, Mac
drives use parity and that HA doesn't handle parity).

>(2) Would I be able to use a Zip Drive instead?

Yes, with the same requirements.

>(2.1) If so, is an Iomega Driver available? I've not seen one on my
>travels.

Not required. SCSI drives do not require special drivers on Atari
systems (and even on PCs, a generic driver is usually enough).

>Also, I've got a 3.5" DD that is formatted to just over 800K - yet when
>I format using the OS, I only get about 706K of space. I need to back up
>the 800+K disk (which has 805K of (crucial)) files on it! Shit! Any
>method of formatting to 810K or something?

Locate and ftp Hcopy or one of the many other floppy copiers. The TOS
desktop formatter is convenient but quite limited. If the disk can be
backed up file-by-file, you can also use the HDformat.CPX to create an
extended density diskette, and then do the file backup.

>PS.. Also looking to get my hands on a manual for such machine

The manual is only slightly better than useless. Instead, take a look
at the References and FAQ links on my Web page. And continue to ask
questions in the newsgroups!

I would have to agree.

>*for some reason I can't use ftp.uni-paderborn.de. If I try the > program
seems to hang. For paderborn I must use the numeric address.

I access ftp.uni-paderborn.de with aFTP without any trouble at all.

>*The graphical environment isn't quite nice.

Well, IMHO it's better than DuFTP.

>*The manual is in very bad Engish (at least the manual I have)

Not that you need any manual, it's so easy to use.

And apart from that, aFTP is not nearly as buggy as DuFTP.

# 1171. Seagate SCSI HD.. Will it work on a ST with ICD Link

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: Mike Harvey <mike.harvey@worldnet.att.net>
Message-ID: <32E30367.6954@worldnet.att.net>
Source record: 129683

I've been trying to locate a workable replacment for the
Quantum 540 meg SCSI HD that crashed on me..

I got it replace under warrenty, but I got a 1 GIG Quantum Fireball
which according to what I read hear awhile back, required bus arbiration
(so it's hooked up on my clone for now) and a new driver.

I'd like to be able to maintain using my ICD drives if possible.

I found a source for a Seagate ST1480N 400+ meg SCSI 3.5 inch HD.

Does anyone know if these will work, the Seagate webpage shows that
it has a jumper for partiy, but I believe some of these on not to
disable
partity, but just for the HD not to check it upon booting.

I have lots of Syquest EZ-135's with my backups, but would like to get
all
my files back on-line so I can get everything cataloged. Was finally
getting somewhere when I try experement with my Quantrum on another
computer and
it lost it's ability to keep the setting of diabled parity.

If anyone has a good source for HD's that are not to expensive and range
from 340-540 megs with the ability to work on a Mega ST and ICD Link 1,
I'd like to hear from you. (PS, I do have a TT and ADSCSI + Host to be
able
to run the patch to diable the parity).

E-mail to: mike.harvey@worldnet.att.net

Thanks Mike

## 1172. fs Mega ST4

## 1173. Atari Connections?

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: please@no.spam.mail.here
Message-ID: <735_please@no.spam.mail.here>
Source record: 129685

Hi marcf@cableinet.co.uk, on 17 Jan 97 you wrote:

m> Am getting an ST at the weekend (without a monitor). Can someone
m> advise me on the VDU connections for such a computer? Do they have TV
m> tuners, VGA, phono, etc?

Depends on the model.

If it's an STM then there is a built-in modulator and you can just connect to
TV with co-ax.

Otherwise video/audio comes out the back as a 13-pin DIN socket.

There are 3 video modes:

Hi-res monochrome for which you will need a special monitor because of high
frame rate. Look for SM124 SM125 or equivalent.

Medium/Low res colour. Best get an RGB monitor or connect to TV SCART.

> helps...

A thought the original poster of this message already used make1mb trying to fix the game. The game worked fine on a 1Mb machine but threw with bombs on a 4 Mb machine. This happens when a stupid programmer is trying to detect the memory size himself instead of believing the hardware register at $ff8000.

To detect the amount of memory he uses a algorithm like this:

```
memsize=512*1024 ; half a meg
loop:
poke memsize+1,123 ; test patern
if peek(memsize+1)=123 then ; is there memory at memloc+1
memsize=memsize+512*1024 ; give half a meg extra
goto loop
endif
```

When the algorithm finishes memsize contains the right value for the memory size, except on a 4 Mb machine, because poking at 4Mb+1 will cause a bus error (2 bombs).

The way to fix a game using a routine like this is by fixing the wrong code or installing a handler in the bus error trap that returns without crashing the machine.

The only game I know having this problem is sidewinder.

Bye, Hans Wessels

## 1176. Strange Drive problem

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: phantomm@harold.eastky.com
Message-ID: <5brouh$35v@netnews.mis.net>
Source record: 129688

Lately, when copying, moving, or unzipping a file on the external SCSI hard drive with my Falcon, I have noticed that the hard drives data light will stay on and my CD Rom drive will restart.
I have been using ExtenDos v. 2.4, Geneva 1.05 and NeoDesk 4.05.
Today I tried copying a 13+ meg file from a CD to the hard drive. The HD froze in the middle of copying the file, and my CD Rom drive restarted. Then I got errors like, the disk has been removed.
I rebooted with Geneva and NeoDesk disabled. And from TOS 4.04 I tried copying the same 13+ meg file to the same HD partition and it worked with no problems.
I deleted the file, then ran NeoDesk from the Desktop and tried copying the same file to the same place. Well it froze the hard drive until the CD-Rom drive restarted, then it tried to copy the rest of the file but I got drive errors again.
I then exited NeoDesk and tried copying the same file from the CD to the HD and it worked again with no problems.
It seems that NeoDesk is the problem here. But that is strange because I have used it for a long time without any problems. The only thing I can think of is that NeoDesk has become corrupted. But I can't find anything else wrong with it. Before I re-install NeoDesk,
Has anyone experienced this problem?

Source record: 129724

Hello,

Roni Music Home Page offers free down load of the Sweet Sixteen MIDI
Sequencer for Windows and Atari computers.

Sweet Sixteen is a comprehensive and powerful MIDI sequencer for
PC/Windows and
Atari ST/STE range of computers.
Sweet Sixteen offers Piano Roll, List and Transform edit pages as well
as a
dedicated Mixer page you can use for your favourite synthesizer.

Two versions are available:
1. A demo version which is a complete version of Sweet Sixteen with all
file saving disabled.
2. A "lite" version which lets the user save files but certain other
functions are disabled.

Check it out at: http://home1.swipnet.se/~w-11396

>I keep alternating both and can not choose...
>What do you think, what are the pros and cons??
>Anyway, I would like to thank both authors... THANKS for these!!!
>
I've used both but my preference goes to aFTP because

pros aFTP
=========
*if you use an AV-server like Thing v1.09 (not Neodesk 4) you can
down- and upload things just by drag and drop what isn't possible
with DUftp.

*One can sorted things on the remote system by date, name etc.
Isn't possible with DUftp.

*aFTP is still supported what AFAIK can't be said of DUftp.

*Works good together with CAB

*One can upload things what isn't possible with DUftp

*One can view textfile just by double clicking

*Easy to use

Cons aFTP
==========
*for some reason I can't use ftp.uni-paderborn.de. If I try the
program seems to hang. For paderborn I must use the numeric address.

*The graphical environment isn't quite nice.

*The manual is in very bad Engish (at least the manual I have)

Hope this help to make your choose

Easy to use??? My expericience with the PPP-kit isn't quite
satifactory. On several occasions I've tried to install the kit but I
never could bring the whole thing to a happy end.
For me it was a lot easier to install the TAF-package.
Nevertheless I hope to get the PPP-kit working someday.

# 1182. Atari storage questions - please help... I'm going nuts!

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: Marc Fotheringham <marcf@cableinet.co.uk>
Message-ID: <32E1671A.2D54@cableinet.co.uk>
Source record: 129728
Cross-posted to: uk.comp.misc,comp.sys.atari.st

Hi,

Another of my posts to do with the Atari ST! Excuse my ignorance of this system - I'm so good at other systems ;)

Anyway, now that I've gotten my hands on one (520 FM), I discover I need to have a hard disk or something to make life a bit easier (for Cubase).

Can someone clue me in as to the HD situation with an Atari?

(1) Is that a SCSI port on the back of the thing? Can I use my old SCSI external drive from my Mac?

(2) Would I be able to use a Zip Drive instead?

(2.1) If so, is an Iomega Driver available? I've not seen one on my travels.

Also, I've got a 3.5" DD that is formatted to just over 800K - yet when I format using the OS, I only get about 706K of space. I need to back up the 800+K disk (which has 805K of (crucial)) files on it! Shit! Any method of formatting to 810K or something?

Thanks for your patience with my previous posts... I'm not used to these old systems... I'm only a young thing! :)

PS.. Also looking to get my hands on a manual for such machine
--
You have received this grammatically-correct message from:
Marc Fotheringham, (i96mf@tay.ac.uk)
in Dundee, Scotland.

## 1183. Thing Icons

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: faehnle.3@osu.edu
Message-ID: <5bsa4p$rea@charm.magnus.acs.ohio-state.edu>
Source record: 129729

How do I add to my icons.rsc in THING? I tried using ORCS, but it told me that this was not an .rsc file. I would like to use some of the icons from MAGXDESK actually. Is this possible?

Also, has anyone seen the .png pictures on the homepage of HP-penguin? In these pictures, there appears to be icons on the desktop stacked with a 3d look. According to the button bar at the bottom of the pictures, THING is running, but this doesn't look like any version I have ever seen. I am currently using version 1.09e. Are these just unique icons? If so, do you know where I could get them?

Thanks

I think it's caused by a combination of things, so it can be a little arbitrary saying exactly where the bug lies. You might say for example, Hyperpaint has an "oversight" of some kind, I'm guessing, in failing to close VDI workstation(s) on exit. Then TOS 2.06 may have a certain "lack of robustness" in dealing with programs that have that particular oversight. Then Everest's author may make an "unwarranted assumption" about VDI attributes being a certain way when a workstation is opened. Put all three together, you get a symptom, or a "bug" -- but whose fault is it (and who's still in business and can fix it)?

> As for Everest's author; I looked up the "readme" file with it, and it

I wrote Joe about this very problem after registering Everest with him a couple of years ago; he said he'd "pass it along", and that was the last I heard about it. I also wrote Christian Dalichow, and got a one-line reponse back in German: "Empfenger Christian Dalichow @ KI unbekannt!" . . . maybe I should double-check the address.

In this case, the "intermediate" machine was running Linux.

Actually, DE2 and DADE can be used to recover data even if you don't have
an "emergency disc". While DE2 on its own is next to useless for recovering
after a "major" corruption, DADE and an understanding of the GEMDOS
filesystem often lets you recover everything. It doesn't normally take a
weeks work or a lot of luck. You just have to know what you are doing.

Right you are.

>Do they run on a Falcon?

I suppose they run on a Falcon IF and only IF you've installed
MiNT/Mintnet. Both programs only works with that.

>Are they any good?

Yes, one better than the other. See also my previous mailing. But
remember aFTP is still under developement and contains some bugs. I've
spoke with the programmer and he has promish me that the future
version will have some very exciting new possibilities.

>Where can I get them from?
>
ftp.uni-paderborn.de /pub/atari/MiNT/mintnet

look for duftp1_1.lzh and aftp10b2.lzh

>know where I could get them?

AFAIK: it's Thing 1.09 that is running in conjunction with N.AES
(mutitasking system based on a much improved multitos). Some icons
used are existing ones but other are created.
I know one can find some beautiful color icons on the Net but I
can't remember me where they are placed. The only thing I still
know is that they were designed for the Falcon desktop.

## 1199. ExtenDOS Pro problem

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: Martin.Byttebier@ping.be
Message-ID: <853671632_OASIS_@ping.be>
Source record: 129745
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've installed ExtenDOS Pro v2.4a and now it seems I have a problem.
With the most CD's the driver works but with one CD he refuse to open
one directory, The CD (Artworks professional) contains 5 main dirs. I
can open 4 of then but I can't open the fifth.
On my friend's Falcon with Metados the CD is fully readable, so I
suppose the CD itself is oke.
Also it seems the same if I use or not all my usual autoprogs and
acc's so I suppose that I haven't an autoprog or acc that cause the
problem.
I also tried the UNI_BDDS.DOS driver with no luck.
I've notice when I access the CD via a fileselector (Freedom) the name
of the dir I can't open is written in lowercase.
Trying to access the CD with Kobold 3 results give me the following
warning (free translation from German to English)
"the mediumparameters of drive P can't be read
it's possible you can read it in GEMDOS-MODE"
In GEMDOS-MODE I can open the CD but not the fifth dir.
I've installed ExtenDOS Pro on a TT030 4/16 with 19" monochrome
screen. I've NVDI 4 and I normally use Thing or Thing/N.AES

# 1200. FS: Atari ST/Falcon/Lynx & Gameboy stuff & books

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.011997.131718.23@wxs5-16.worldaccess.nl>
Source record: 129746

This is the January 17th version of the list of Atari stuff that I have
for sale.

Because the past month must have been an expensive month for everyone, what
with Christmas and New Year and all...all items in this message have been
drastically reduced in price, until January 31st (SOME OF THE STUFF IS
DIRT-CHEAP NOW)! After that, the prices will be normal again.

ALL THE TITLES BELOW ARE ORIGINALS, PRE-PROD COPIES, OR EVALUATION
COPIES (so you might not be able to upgrade all utilities).
NONE OF THESE TITLES ARE PIRATE COPIES!

---

FIRST CATEGORY: GAMES FOR ST, WITHOUT MANUAL, WITHOUT BOX

Games with + are excellent games that I've played for hours and hours...

+Airball
Airball Construction Kit
Arena (2 disks, Psygnosis)
+Arkanoid (Imagine/Ocean) (SOLD)
Backlash (Paul Woakes, Novagen)
+Barbarian (2 disks, Psygnosis)
Black Lamp (Firebird)
+Blood Money (2 disks, Psygnosis, bloody excellent game)
Brattacas (Psygnosis, classic hi/med res game)
+Bubble Bobble (disk will handled, was my absolute fave game) (SOLD)
+Chaos Engine (2 disks, disks patched for use on Falcon, can't press any keys
until the game starts or it won't work; don't know if it still works on the ST)
(SOLD)
Deep Space (2 disks, Psygnosis)
Defender II (ARC/Atari, by Jeff Minter, classic game, but difficult to play)
(SOLD)
Dragonflight (Thalion, 2 disks, double-sided drive required) (SOLD)
+Dungeon Master (SOLD)
+Enchanted Land (Thalion) (SOLD)
Extensor 3.3 (Tron-like game, monochrome only, by Golden Games, ancient)
+Formula One Grand Prix (excellent game, 3 disks, includes manual that you need
for the copy protection - passwords)
+Gods (superb game, two disks, by Bitmap Brothers)
+Goldrunner II (boot/game disk plus data disk, by Microdeal, 2 disks in total)
+Goldrunner II Pete Lyon data disk
Goldrunner II some other guy official data disk
+Gridrunner by Llamasoft, excellent game by Jeff Minter (SOLD)
Hitchhiker's Guide to the Galaxy, the original Infocom adventure (alas, no

gadgets anymore, I lost 'em all) (SOLD)
Jambala, the Seven Gates of (Thalion, DS disk version)
+James Pond (by Steve Bak, Millenium Software, preview copy, but is a full one)
(SOLD)
Jupiter Probe (legendary Steve Bak shoot-em-'up with Rob Hubbard Music)
The Killing Game Show (Psygnosis, 2 disks)
+Leatherneck (Microdeal shoot-em-up, really cool, you have to disconnect
printer to
get it to work, does not work on Falcon, alas)
+Lemmings (need I say more?) (SOLD)
+Oh No! More Lemmings (totally addictive) (SOLD)
+Lemmings 2 (more addiction) (SOLD)
+Lethal XCess (absolutely great shoot-em-up from the author of Wings of Death,
by Eclipse, 2 disks)
+Little Computer People (Activision, really cute game) (SOLD)
+Magic Pockets (great Bitmap Brothers game, one disk)
Monster Business (platform game, Eclipse design)
+Nebulus (by John Phillips, excellent game) (SOLD)
+Obliterator (2 disks, Psygnosis)
Photon Storm (hellishly difficult Jeff Minter game) (SOLD)
+Prehistoric Tale (Thalion game, coded by The Lost Boys, platform thing)
+Return to Genesis (the first true horizontal smooth scrolling shoot-em-up by
Steve Bak, excellent graphics, great game)
+Revenge of the Mutant Camels, registered version for 1 Mb ST
+Rick Dangerous (pre-prod copy, looks dodgy but is full version, and legal too.
Heavily used, was one of my fave games)
+Rick Dangerous II (also a fave!)
The Sentinel (legendary Firebird game with 10000 levels or whatever) (SOLD)
Shaolin, Chambers of (Thalion, Martial arts game, 2 disks)
+International Soccer (Microdeal, I think it's the best soccer game ever on the
ST)
Spaceport (like Fort Apocalypse on the C-64, great concept, dodgily programmed)
Starglider (the legendary Jez San game!)
ST Karate (great graphics, old karate game by Paradox)
Stone Age (really nice puzzle game by Eclipse, excellent graphics, DOUBLE
FORMAT, WORKS ON ST AS WELL AS AMIGA!!)
STrikey (Pacman clone by STRIKE-a-LIGHT, ancient)
Teramis, Leavin' (vertical scroller, shooting about spaceship, Thalion game)
Terrorpods (2 disks, graphically impressive, Psygnosis)
Virus (legendary David Braben 3D game, by Firebird, doesn't work on all disk
drives (sometimes you have to press the 'eject' button lightly) (SOLD)
+Warhawk (budgetware shoot-em-up by Silverbird, with Rob Hubbard music)
+War in Middle Earth (RPG "Lord of the Rings", *really* impressive, 3 disks,
Melbourne House)
Warp (nice Thalion shoot-em-up, graphics by ES of TEX)
+Wings of Death (truly great 2 disk shoot-em-up, by Thalion, several levels
have graphics by ES of TEX)

COSTS: Remember, no manuals and packaging. All I'll be sending you is the
disks. I am selling all this stuff at 1.5 British pound per disk. Refer to the

end of this text for more details. This includes postage and packaging.

---

SECOND CATEGORY: UTILITIES

These are sold without manuals either, unless specified. All original stuff, no pirate stuff.

1st Word Plus, 3.20 TT (2 disks) *
1st Extra (1 disk, version 1.03, allows index/contents etc. for 1st W+)
Crypt It (old Tommy Software encryption thing)
Degas Elite (Batteries Included) *
Diamond Edge, the latest version 2 ** (with manual) (SOLD)
Diamond Back 3 ** (with manual) (SOLD)
Ed Hak (editor) *
FastCopy Pro 1.2 * (works on Falcon)
G.I.S.T. the Sound Tool
Desktop Butler James *
Geneva ** (1 disk, but this one counts as 2 disks), latest patched version, manual available) (SOLD)
Imagecopy 2 * (2 disks)
Imagecopy 3 ** (3 disks)
Imagecopy 4 ** (2 disks) (with manual) (SOLD)
K-Rhyme (rhyming accessory) * (SOLD)
Mortimer (desk thing by Omikron)
Mortimer Plus * (see above)
Mouse Tricks 2 *
Neodesk 4 ** (1 disk, but this one counts as 2 disks), latest patched version, manual available) (SOLD)
Positive Image ** (2 disks, version 1.0, manual available)
Protext 5 ** (4 disks, and I also have the manual)
Le Redacteur ** (4 disks) (SOLD)
Spectrum 512 * (512 colour drawing program, regular ST only)
Turbo ST (screen speeder, ST only)
Universal Item Selector III
View II * (by DMJ software, good stuff)
Warp 9 ** (3 disks, version 3.81, best for ST)
Xboot 3.10 *

COSTS: The regular ones cost 1.5 English pounds per disk. Titles with one * cost 3 English pounds. Titles with two ** cost 5.5 English pounds extra. If you want the manual sent, add 2 extra pounds). Do note: Protext/Le Redacteur manuals are big whoppers of things, so those will cost 4 pounds extra instead of 2.

---

THIRD CATEGORY: DEMOS.

This is basically a collection of demos that I have. The price varies per demo, and is given for each title. The price specified is in British pounds, so if you want to make another currency of it, check the "additional payment

details", below. All demos are ST only!
!! These demos can only be fill-up orders, or orders if you have ordered more than 10 British pounds worth of the first and second category !!

BIG Demo (with handwritten text by ES of TEX, ST only) price: 2
Amiga Demo (ST only): 1
California Beach Girls (fantastic monochrome slide show of girls by the Denise Team. Classic old demo, requires DS disk drive, monochrome only!): 1
Thalion Sound Demo (a copy-protected rare Thalion sound demo, done in 1988, with Mad Max music. Never officially released. You can't put this in a PD library because it's copy-protected!): 1
FNIL (large DS disk drive demo by TNT crew): 1
DEF Demo (1 meg version of the first TLB demo, with hand-written label by Tim of the Lost Boys himself!): 2 (SOLD)
TCB New Year's Demo: 1
Union Demo: 1
Cuddly Demos: With hand-written stuff by Nic of TCB: 1
Whattaheck Demo: With hand-written stuff by NIC of TCB: 1
Decade Demo by Inner Circle: With hand-written stuff by Griff of Inner Circle, final version of 12 sep 1990, STE compatible: 1
Dark Side of the Spoon (by ULM, megademo, with custom ULM label): 1
Lightning Demo (by pendragons, with handwritten label by pendragons): 1
Punish Your Machine (two disk demo, excellent, by Delta Force): 3
Ultimate Muzak Demo (by PHF), volumes I through V, five disks, only sold as a set, all with hand-written labels by Grazey of PHF: All five for 5
Ventura Demo (2 disks, I think it's by ST Connextion, with hand-written labels by them): 2
Reality is a Lie: 1
Black and White: Rare Polish megademo, with hand-written stuff and pix by them on label: 1.
Colorz: By Haemaroids, hand-written label by them: 1.
Froggies over the Fence: Three disk "last of the true megademos", released september 1993, with custom Overlanders "Froggies over the Fence" graphic labels": 7 for all three disks.
The Beginning of the Ending demo by Flexichron: Handwritten label by Offbase of Flexichron: 1.

---

FOURTH CATEGORY: MISCELLANEOUS

ATARI CD ROM

I also have for sale the Suzy B's Software Treasury, a double CD ROM with over 1000 Kb of Atari stuff, too much to even begin to summarize here. It's yours for 15 British pounds (or the equivalent), including postage (2.5 British pounds - or equivalent - extra in case you live outside Europe).

ATARI ST CARTRIDGES

And then there's the "Multiface II" and "Ultimate Ripper" cartridges. I also have those. They're ST-only, NO FALCON COMPATIBILITY. I haven't got the

manuals anymore either. If you're interested, email me with an offer (I had in mind about 5 British pounds each).

LYNX CARTRIDGES

The following Lynx games are available for 3 British pounds each:

(No manuals and boxes)

Gauntlet (SOLD)
Ninja Gaiden
Rampage
Robosquash (SOLD)
Todd's Adventures in Slimeworld (SOLD)

I am willing to swap any of those for Battlewheel.

GAMEBOY CARTRIDGES

(No manuals and boxes)

The following Nintendo Gameboy games are available for 3 British pounds each:

Bubble Bobble (difficult to play, a real challenge)
Dragon's Lair (beautiful graphics, difficult to play)
Hyper Lode Runner (the classic game)

I am willing to swap any of these for that old tennis-game that was released for the Gameboy in 1989 or 1990.

BOOKS

Books in German:

Atari ST/STE/TT Profibuch (Sybex) THE programming bible, in mint condition. Asking price 25 Dutch guilders or 25 German marks.

Das Buch Zum Atari Falcon 030 (Data Becker). Asking price 10 Dutch guilders or 10 German marks.

Das Grosse ST Viren Schutzpakket (Data Becker) Originally with disk, but I haven't got that anymore. Asking price 10 Dutch guilders or 10 German marks.

GfA Basic (book by Frank Ostrowski, including disk). 10 Dutch guilders or 10 German marks.

GfA Handbuch TOS & GEM (GfA Systemtechnik). 10 Dutch guilders or 10 German marks.

Atari ST Floppy und Hard disk (excellent book, Data Becker, hardcover). 20 Dutch guilders or 20 German marks.

Das Grosse GfA Basic Buch (Data Becker, hard cover). 15 Dutch guilders or 15 German marks.

Scheibenkleister II (by Claus Brod, THE mass storage media bible, with disk).
20 Dutch guilders or 20 German marks.

Book in Dutch:

Programmeren van Basic naar C (Data Becker). 10 Dutch guilders.

If you're interested, please email me (please also mention the country where you live, so I can estimate the postage costs). ALL BOOK PRICES MENTIONED HERE ARE WITHOUT POSTAGE!!

- READ THE BITS BELOW!! READ THE BITS BELOW!! ------------------------------

ADDITIONAL PAYMENT DETAILS:

I would like people in Europe to pay in British pounds or German marks (German marks = British pounds multiplied by three). People from the Netherlands can pay in Dutch guilders (British pounds multiplied by three). I have to request people outside Europe have to pay in American dollars (British pounds multiplied by 2). No cheques, just cash or International Money Orders from the post office.
I don't like to receive any coins, so fill up your order to the nearest paper bill if necessary. If you pay with Dutch guilders or German marks, make sure the amount is divisible by 10. If you pay in dollars, simply round off the amount to the next whole dollar and use US$ 1 bills.

GUARENTEE

I can't give any guarentees. Some of the games are old, and some of them have been sitting in my disk boxes for quite a while. All ST-specific titles have not been played since 1993 or so. I am not out to rip anyone off. I have been doing "ST NEWS" and have been doing (and will be doing ) "Ultimate Virus Killer" for quite some time and I hope people know that I can be trusted.

WANT SOME?

Email your order and WAIT FOR CONFIRMATION (DON'T SEND ANY MONEY YET). The quickest mailer gets the first right on a given title. I'll mail back to confirm and then you can send off the dosh. I will despatch the disks by return mail.

> text" message goes away. Anyone know why CAB does this? It
> seems to delay the loading of web pages from the cache also.

That happened to me on my Hades 060 clone sometimes. I really do not care about it as long as the website loads. What version of CAB and CAB.OVL are you using. Try switching to another version of CAB.OVL and see it that helps.

Take DOITF03H.ZIP (Release V 4.8 HTML)

You found a lot of german/english informations about the F030.
(More about the Hardware and also)

http://www.rhein-main.de/people/robert/homepage.htm

Regards, Robert

>doesn't do Zmodem correctly!

Yes, it handles Lynx just fine (I use it every day) and Zmodem as well (I
use that every day as well to download/upload my email/news.
As for X or Y modem... I have to check this, because I never use it.
If it's not included in the program itself you can install external
programs for it (I've done that for "Kermit", just in case I need it some
day).

I also used STorm prior to Connect, but like you I experienced Zmodem not
working (even with the new "fix" patch installed!).

The only annoyance/problem I have with Connect is that when I access pages
with accented characters (or any character outside the usual English
alphabet, such as Norwegian, Swedish, German, French etc.) the program
automatically changes over to the "Graphic" character set, so those
characters get messed up.

In those cases I have to go back to the "character set" menu, set it back
to like it was and do a "screen refresh/reload". Irritating!
The author of the program told me that the UNIX server sends some sort of
control codes to Connect to do this, but apparently something is set up
wrong since I'm not supposed to get access to graphic characters when the
ISO character set should be used instead....
I hope a solution to this problem comes by.

Other than that I'm very happy with Connect, so I'd say- try it out and use
it for a while (you can use it for 30 hours without registering!).
If you register you'll get a user manual and access to some extra features
(like automatic login etc.).

# 1205. Complete list of viruses recognised by UVK (big)

Newsgroup: comp.sys.atari.st
Date: 1997-01-19 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.011997.165844.32@wxs5-12.worldaccess.nl>
Source record: 129751

THE KNOWN VIRUSES ON ATARI AND THEIR SYMPTOMS

This is a systematic description of all viruses that are
recognized by the "Ultimate Virus Killer". It is of a rather
technical nature; in case you are interested but you don't know
what to do with all the various phrases you get hurled at you,
please refer to books on the subject.

Name: Official name of the virus. When several different versions
of one virus exist, their difference is indicated by one additional
character - "A" for the earliest or most widely spread version, "B"
for the next, etc.
Type: The description of the virus fitting the most common virus
classification.
Discovery date: The date when the virus was earliest reported to
be seen. If the discoverer is known, his/her name is added between
brackets.
Virus can copy to drive(s): This indicates to which drives the
virus can copy itself. "Current drive" implies that the virus
copies to the drive that is currently in use of the ones listed.
Virus attaches itself to: Here it is mentioned which system
vector(s) the virus attaches itself to. When indicated to be
'undocumented reset-proof', this refers to the undocumented method
for programs to become reset-resistant through the $12123456
method.
Disks can be immunized against it: Informs of whether a virus
cannot be immunized against, or whether it can be immunized
against. In the latter case, it is indicated how one can immunize
against it. The format of the immunization method is: Offset
(hexadecimal), Byte/Word/Longword, and the hexadecimal value
expected at that offset.
Disks can be immunized with UVK: Indicates whether or not a
particular virus' immunization was capable of being including in
the "Ultimate Virus Killer" advanced immunization method.
What can happen: Lists the effect that the virus is programmed to
cause to occur.
When does that happen: Specifies when the above will happen
(ahem).
Reset-proof: Tells you whether or not the virus can survive a warm
reset.
Can copy to hard disk: Tells you...er...well...this is pretty
obvious, actually.
Remarks: Here all the other things worth mentioning are summed up.

BOOTSECTOR VIRUSES

Virus #1

Name: Signum/BPL Virus A.
Type: Memory-resident bootsector virus.
Discovery date: November 22nd 1987 (Klaus Seligmann).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: Yes (0.W $6038).
Immunizable with UVK: Yes.
What can happen: Not known.
When does that happen: When key is found on other disks (this has never been found - yet).
Reset-proof: No.
Can copy to hard disk: No.
Remark: This is the most widely spread virus; an approximate estimate brings it to at least 1.5 million copies worldwide! It is also known as the Emil 1A virus.

Virus #2

Name: Mad Virus A.
Type: Memory-resident bootsector virus.
Discovery date: March 26th 1988 (Eerk Hofmeester).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_rw vector.
Disks can be immunized against it: Yes (0.B $60).
Immunizable with UVK: Yes.
What can happen: Fools around with screen or bleeps with the sound chip.
When does that happen: After it makes five copies of itself, and then at every disk access.
Reset-proof: No.
Can copy to hard disk: No.
Remark: A relatively harmless virus, therefore also sometimes referred to as 'FUN Virus'. This is improper, however, as there already is a virus sometimes called 'Fun Virus', too (the Merlin Mad Virus, #60). For more remarks on the 'Mad Virus', see Mad Virus B (#49). Weirdly, the Mad Virus is also known as Emil 2A Virus.

Virus #3

Name: Signum/BPL Virus B.
Discovery date: Summer 1988 (Anton Raves).
Symptoms: Disk on which the virus is present is unreadable due to a damaged BPB.
Remark: This is no true other virus, but a virus that was corrupted while active in the system. For more info see the Signum/BPL Virus A.

Virus #4

Name: ACA Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: June 29th 1988 (Little Joe).
Virus can copy to drive(s): Boot device.
Virus attaches itself to: Undocumented RESET-resistant.
Disks can be immunized against it: Yes (0.B $60 or 4.W $4143)
Immunizable with UVK: Yes.
What can happen: Track 0 is cleared (BPB, bootsector and FAT).
Data is then irretrievably lost.
When does that happen: After it has made 10 copies of itself.
This is done each time you press reset.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: This virus is made by the ACA crew (ACA stands for Anti
Copyright Association) from Sweden. In April 1990 it became known
that this ACA crew also made a virus killer (with lotsa graphics
and a scroller in the lower border). This killer could allegedly
also SPREAD viruses when you pressed a certain key combination! In
a 1988 issue of the German "ST Magazin" an interview with ACA was
published, in which they stated to have written (but not spread)
even worse viruses.

Virus #5

Name: Freeze Virus.
Type: Memory-resident bootsector virus.
Discovery date: July 12th 1988 (Carsten Frischkorn).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_rw vector; also installs MFP
interrupt.
Disks can be immunized against it: Yes (0.B $60).
Immunizable with UVK: Yes.
What can happen: The system slows down more and more, until it
freezes.
When does that happen: Right from the beginning on, increasing at
every access of logical sector 11 (directory).
Reset-proof: No.
Can copy to hard disk: No.

Virus #6

Name: Screen Virus.
Type: Memory-resident bootsector virus.
Discovery date: July 12th 1988 (Carsten Frischkorn).
Virus can copy to drive(s): A.
Virus attaches itself to: Hdv_bpb vector; 200 Hz System Clock
vector; Etv_critic vector.
Disks can be immunized against it: Yes (executable).
Immunizable with UVK: Yes.
What can happen: Screen is blackened.
When does that happen: 54 minutes after virus installation.
Reset-proof: No.

Can copy to hard disk: No.
Remark: Only works on 02.06.1986 ROMs (German pre-blitter TOS).

Virus #7

Name: C'T Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: Summer 1988 (Wim Nottroth).
Virus can copy to drive(s): Any (including hard disk).
Virus attaches itself to: Undocumented RESET resistant.
Disks can be immunized against it: Yes (executable).
Immunizable with UVK: Yes.
What can happen: Deletes FAT of floppy-and hard disk (all data irretrievably lost).
When does that happen: If date stamp is 1987.
Reset-proof: Yes.
Can copy to hard disk: Yes.
Remark: This virus was featured in a German magazine called "Computer & Technik". The author claims he 'found it' on one of his disks. A listing was included, so that people could reproduce and adapt the virus with ease. It writes the message "ARRRGGGHHH Diskvirus hat wieder zugeschlagen" on the screen when it is activated. Due to the fact that it forgets to check whether or not the device is higher than "B", it can also copy itself to hard disk (which will most likely cause permanent damage).

Virus #8

Name: Maulwurf I Virus B (English TOS version).
Type: Reset-proof memory-resident bootsector virus.
Discovery date: September 3rd 1988 (Joerg Kruse).
Virus can copy to drive(s): A of B (current drive).
Virus attaches itself to: Reset vector, Hdv_bpb vector and VBL vector (this virus operates out of the VBL!).
Disks can be immunized against it: Yes (0.W $601C or 2.W $001C, AND must be executable).
Immunizable with UVK: Yes.
What can happen: Message on screen "Maulwurf I - SSG (Subversive Software Group)" and computer locks up.
When does that happen: If original Hdv_bpb vector is re-installed, or when someone changes the Hz200 counter.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: This virus was made by the Subversive Software Group in Germany. It is also called "Caterpillar Virus", as that is its name in English.

Virus #9

Name: Bayerische Hacker Post (BHP) Virus.
Type: Memory-resident bootsector virus.
Discovery date: September 10th 1988 (Henrik Alt).

Virus can copy to drive(s): A or B (current drive)
Virus attaches itself to: Hdv_bpb vector
Disks can be immunized against it: Yes (ANY value on 0.W)
Immunizable with UVK: Yes
What can happen: Nothing. It only copies itself
When does that happen: Never (how could it?)
Reset-proof: No
Can copy to hard disk: No
Remark: Made by the Bayerische Hacker Post. This is a small
computer user's group in Germany that also publishes a small club
magazine. In that magazine, the virus was said to reset- proof,
and that it would 'write through the write-protect notch'
(haha!). None if this is true. It checks the WP notch, however, in
a way that only works successfully on pre-blitter TOS versions
(i.e. TOS version before 1.02). The Bayerische Hacker Post
address: c/o BASIS, Adalbertstra�e. 41b, D-8000 M�nchen 40,
Germany.

Virus #10

Name: Lab-Virus.
Type: Memory-resident bootsector virus.
Discovery date: September 10th 1988 (Henrik Alt).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Screen is made entirely black.
When does that happen: After copying itself 10 times.
Reset-proof: No.
Can copy to hard disk: No.
Remark: Checks the write-protect status address in an illegal way,
and will therefore not work correctly on any TOS version above
1.04. This virus seems to be an adapted version of the BHP virus.

Virus #11

Name: FAT-Virus.
Type: Reset-proof memory-resident bootsector call virus.
Discovery date: May 1st 1988 (Stephen E. Schneider).
Virus can copy to drive(s): A.
Virus attaches itself to: Hdv_bpb and reset vector.
Disks can be immunized against it: Yes (executable).
Immunizable with UVK: Yes.
What can happen: Random memory accesses, resulting in blots
appearing on the screen and current programme running crashing.
When does that happen: After three hours, and then at the first
time $114 is changed from its original value (this is the MFP
Interrupt 5 vector).
Reset-proof: Yes.
Can copy to hard disk: No.

Remark: Only works on 02-06-1986 ROMs (German TOS 1.00). It uses time delays to make it more difficult to detect. This virus spreads easily and rapidly. It is bigger than just one bootsector and also uses the last FAT sector to write itself on. It is probably made in Switzerland, and is also called "Swiss"-or "Blot"-virus.

Virus #12

Name: Ghost Virus A.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: November 20th 1988 (Carmen Brunner).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb and resvector; it is also non-documented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Mouse Y directions are inverted.
When does that happen: After copying itself 10 times. At every further five copies, the mouse movements are inverted, then normalised, then inverted again, etc.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: RUMOURED to be made by someone called Pash in Doncaster, England. It is very widely spread (England, Holland, Sweden and West Germany in particular). It is also called "Mouse" virus and "Inversion" virus.

Virus #13

Name: 5th Generation Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 6th 1988.
Virus can copy to drive(s): A.
Virus attaches itself to: Trap #13 vector.
Disks can be immunized against it: Yes (executable).
Immunizable with UVK: Yes.
What can happen: Writes trash in the first 34 sectors of a disk, lethally corrupting the bootsector, FAT, and directory.
When does that happen: When the virus has reached its fifth generation.
Reset-proof: No.
Can copy to hard disk: No.

Virus #14

Name: OLI Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: December 10th 1988.
Virus can copy to drive(s): Boot device.
Virus attaches itself to: Hdv_rw and trap #14 vector; also non-documented reset-resistant.

Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The text "OLI-VIRUS installed ." appears on the screen. Then, it starts slowing down the ST by hooking itself on an interrupt vector. In certain cases, it can also corrupt disk data.
When does that happen: After having made 20 copies of itself.
Reset-proof: Yes.
Can copy to hard disk: No.

Virus #15

Name: Maulwurf I Virus A (German TOS version).
Discovery date: January 1st 1989.
Symptoms and remark: See virus #8. Only three branch addresses are different, so as to work on German instead of English TOS.

Virus #16

Name: Kobold #2 Virus A.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: January 2nd 1989.
Virus can copy to drive(s): A (?).
Virus attaches itself to: Hdv_bpb and resvector; Vbl_queue; also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The mouse UP and LEFT directions will be slightly distorted, resulting in the user slowly moving it off the desk.
When does that happen: Whenever XBIOS functions are called.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: This is the toughest virus yet. Not many statements can be made about it with certainty. It installs itself in memory on booting, and only after ANOTHER reset will it install the vectors mentioned above. Then, it will also print the text "KOBOLD#2 AKTIV!" (this leads to the belief that the virus is German). Confusingly, there is also a "Kobold AntiVirus". This is a "virus free" disk written by the German fast file copy program "Kobold". It is no true Antivirus.

Virus #17

Name: Mad Virus C.
Discovery date: January 1989 (Frits Couwenberg).
Symptoms: See virus #2.
Remark: Some of the last screen fiddle/sound routines in this virus have been corrupted by alien code. It will therefore crash when these routines are executed.

Virus #18

Name: Mutant Antivirus #1 A.
Discovery date: January 28th 1989.
Symptoms: Copies itself to other disks (except when they're executable). Some of the latter half of its code is corrupted by alien code, however, and may/will result in a system crash.
Remark: Read further for more info about anti-viruses.

Virus #19

Name: Goblin Virus A.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: April 3rd 1989 (Clive Duberley).
Virus can copy to drive(s): A or B (drive used by disk access call).
Virus attaches itself to: Hdv_bpb and resvector; also non-documented reset-resistant.
Disks can be immunized against it: Yes (1A2.L $27182818).
Immunizable with UVK: Yes.
What can happen: It puts the message "The Green Goblins Strike Again" on the screen; it can also mess up the display.
When does that happen: The message appears after 128 copies of itself have been made; the messing up of the display is done after 16 copies of itself have been made.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: Probably made in England.

Virus #20

Name: Mutant Antivirus #1 B.
Discovery Date: March 6th 1989 (Thomas Gathen).
Symptoms: System crashes, mainly. This is just a gigantically busted AntiVirus #1, and really can't do anything decent. Most probably doesn't even multiply...

Virus #21

Name: Counter Virus.
Tyoe: Memory-resident bootsector virus.
Discovery Date: May 1989.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: ?.
Disks can be immunized against it: ?.
Immunizable with UVK: ?.
What can happen: Nothing.
When does that happen: Never (would it?).
Reset-proof: No.
Can copy to hard disk: No.
Symptoms: This virus keeps a generation counter, but doesn't do anything more.

Virus #22

Name: Help Virus.
Type: Memory-resident bootsector virus.
Discovery date: September 1988.
Virus can copy to drive(s): None.
Virus attaches itself to: ?.
Disks can be immunized against it: ?.
Immunizable with UVK: ?.
What can happen: Screen is filled with bombs.
When does that happen: At booting.
Reset-proof: No.
Can copy to hard disk: No.
Remark: No real virus, because it actually cannot multiply without external help. Since it resides in the bootsector, since another virus killer classified it as a 'virus' and since it does something a computer user would not like, it is still listed here as a 'virus'.

Virus #23

Name: Exception Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: September 1988.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb vector, undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: System crashes due to random values written to random memory locations.
When does that happen: About 22 minutes after a vbl routine is installed, which happens after accessing a non-write protected disk in drive A or B.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: Does not work when Hdv_bpb points at an address below $FFFF (generally this is the case when a hard disk is installed). It was previously also known as Random virus, and it only works on TOS 1.00 and 1.02.

Virus #24

Name: Gauweiler Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: July 12th 1989 (Harald Wend).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb; undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Writes "AIDS?" on the screen and zeroes track 1 of a floppy disk (irretrievably destroying bootsector, FAT, and directory).
When does that happen: After the first reset after booting it.

Reset-proof: Yes.
Can copy to hard disk: No.
Remark: Version 3.0 of this virus (version number contained in boot code) is supposed to be programmed on July 7th 1988 (also contained in boot code). So it was almost exactly one year old when it was discovered...

Virus #25

Name: Evil Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: May 23rd 1989 (Jeremy Hughes).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Resetvector and Hdv_bpb.
Disks can be immunized against it: Yes (0.L $60380666).
Immunizable with UVK: No.
What can happen: Screen colours inverted.
When does that happen: After 100 copies of itself are made.
Reset-proof: Yes.
Can copy to hard disk: No.
Remarks: Contains the text " EVIL ! - A Gift from Old Nick". It is written in England. Obviously, the author acquired a copy of an earlier version of the "Ultimate Virus Killer" - he made sure the virus was recognized to be an Atari system disk! Very cleverly done, by using the recognition bytes somewhere in the virus code. I am glad to say that we're now at least ONE step ahead of this guy!
This virus is very often found in Scandinavian countries.

Virus #26

Name: P.M.S. Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: May 20th 1989 (Chris Dudley).
Virus can copy to drive(s): A.
Virus attaches itself to: XBIOS trap vector and reset vector.
Disks can be immunized against it: Yes (1B4.L $2A2A2A20).
Immunizable with UVK: Yes.
What can happen: Text "*** The Pirate Trap ***, * Youre being watched *, *** (C) P.M.S. 1987 ***" (sic) appears on the screen.
When does that happen: At each fiftieth copy of itself that is made.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: Contains a copyright message for 1987 (!). This virus might thus be VERY old and it is a miracle that is had slipped through the attention of ALL virus killers thus far. It is thought to be made by a software vendor to prevent people from copying software in his shop. Due to obvious reasons, it is also called "Pirate Trap Virus".
This virus patched the XBIOS vector in such an effective way that,

once the virus is in memory, it even patches bootsector reads to hide its presence. It copies itself at each use of Floprd (XBIOS 8)!

Virus #27

Name: Ghost Virus B.
Discovery date: June 15th 1989 (R. de Groen).
Symptoms: See Virus #12 (Ghost Virus). This virus has a few damaged bytes and will therefore crash easily.

Virus #28

Name: Arnold/Rambo Virus.
Type: Memory-resident bootsector virus.
Discovery date: November 1989.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: Yes (0.B $60).
Immunizable with UVK: Yes.
What can happen: Nothing.
When does that happen: After five copies were made.
Reset-proof: No.
Can copy to hard disk: No.
Remark: This virus was actually designed to have precisely the same effects as the Mad virus, but due to a wrong branch and a non-working counter this does not work.

Virus #29

Name: Monitor Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: November 1989.
Virus can copy to drive(s): A or B.
Virus attaches itself to: ?.
Disks can be immunized against it: ?.
What can happen: Random lines are put on the screen.
When does that happen: ?.
Reset-proof: Yes.
Can copy to hard disk: No.
Symptoms: Some random lines are put on the screen, which are probably meant to hint at a busted monitor. Of course, this virus doesn't harm the monitor at all.

Virus #30

Name: Anti-ACA Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: GEMDOS trap vector.
Disks can be immunized against it: Yes (0.W $601C).
Immunizable with UVK: No.

What can happen: Text "GREETINGS TO ACA, THE FIRST GROUP TO BE GREETED IN A VIRUS! (AND THEY ARE THE GUYS WHO MADE THE 1ST ST VIRUS" on screen, followed by the computer crashing.
When does that happen: After four copies of itself are made.
Reset-proof: No.
Can copy to hard disk: No.
Remarks: This virus was written in Norway by someone called himself The Lazy Lion (as were viruses 31-36!). Actually, unlike this virus claims, the first virus on the ST was not that of the ACA (but who cares).
All these viruses patch the GEMDOS trap vector, and will get active and/or copy themselves at any Fopen or Fsfirst GEMDOS call.

Virus #31

Name: Chopin Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A.
Virus attaches itself to: GEMDOS trap vector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Music of Chopin's Death March start playing endlessly and system freezes to a halt. At each music end, it also prints the message "FUCK! YOU'VE GOT A VIRUS!" on the screen.
When does that happen: After 26 copies of itself are made.
Reset-proof: No.
Can copy to hard disk: No.

Virus #32

Name: Cookie Monster Virus A.
Type: Memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A.
Virus attaches itself to: GEMDOS trap vector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Writes "YOU KNOW WHAT? I WANT A COOKIE!" on the screen, and then waits for the user to type COOKIE. After having done this, it will enable the user to continue whatever he was doing. After each 20 further copies, it appears again.
When does that happen: After 30 copies of itself are made.
Reset-proof: No.
Can copy to hard disk: No.

Virus #33

Name: Cookie Monster Virus B.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A.

Virus attaches itself to: GEMDOS trap vector and resvector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: See virus #32.
When does that happen: See virus #32.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: The only difference with virus #32 is that it is reset-
proof.

Virus #34

Name: Puke Virus A.
Type: Memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: GEMDOS trap vector.
Disks can be immunized against it: Yes (0.W $601C).
Immunizable with UVK: No.
What can happen: First file deleted from current floppy drive.
When does that happen: After five copies of itself are made.
Reset-proof: No.
Can copy to hard disk: No.
Remark: The boot code also includes the address of a well known
member of the ST society, who was supposed to be blackmailed using
this virus (but who did NOT write it!).

Virus #35

Name: Puke Virus B.
Type: Memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: XBIOS trap vector.
Disks can be immunized against it: Yes (19E.L $70756B65).
Immunizable with UVK: Yes.
What can happen: Track 1 gets the memory contents of $78000 (screen
memory on half meg machines) written on it (irretrievably
corrupting bootsector, FAT and directory sectors).
When does that happen: After making five copies of itself, and
then after each second copy.
Reset-proof: No.
Can copy to hard disk: No.
Remark: See virus #34.

Virus #36

Name: Upside Down Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 28th 1989.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: GEMDOS trap vector.

Disks can be immunized against it: Yes (0.W $601C).
Immunizable with UVK: No.
What can happen: Screen turns upside down.
When does that happen: After four copies of itself are made, and
then after each second copy.
Reset-proof: No.
Can copy to hard disk: No.
Remark: Due to a small bug, it seems to write only non- executable
copies of itself?

Virus #37

Name: Mutant Antivirus #4.
Discovery date: Autumn 1989.
Symptoms: As this is an anti-virus with almost 50 percent of its
code destroyed, it probably only crashes the system on boot-up.

Virus #38

Name: G-DATA Virus.
Type: Memory-resident bootsector virus.
Discovery date: May 5th 1990.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: Yes (0.B $60).
Immunizable with UVK: Yes.
What can happen: Nothing.
Reset-proof: No.
Can copy to hard disk: No.
Remark: This virus was not written by G-Data (which is a German
company that has also made a virus killer), but owes its name to
the fact that it contains the message "ANTI-VIREN KIT 3KEIN VIRUS
IM BOOTSECTOR" (translation: "ANTI-VIREN KIT 3NO VIRUS IN THE
BOOTSECTOR"), suggesting that it is a disk immunized by the G-Data
virus killer (which, of course, it isn't). It's based on the
Exception Virus.
It's also called "G-DATA Laxy Virus".

Virus #39

Name: Media Change Virus.
Type: Reset-proof memory-resident bootsector viruses.
Discovery date: October 27th 1989.
Virus can copy to drive(s): All boot devices.
Virus attaches itself to: Mediach (Media Change) vector, and
undocumented reset-resistant.
Disks can be immunized against it: Yes (executable).
Immunizable with UVK: Yes.
What can happen: Text turns to screen colour.
When does that happen: Every fifth copy.
Reset-proof: Yes.
Can copy to hard disk: Yes.

Remark: Since it does not check for drives higher than B, and
since it uses the BIOS Rwabs call, it can also copy to hard disk
when you have booted from that!

Virus #40

Name: Ghost Virus C.
Discovery date: March 9th 1990.
Remark: A version of the original Ghost Virus in which three bytes
have been corrupted, causing the branch to be (non-fatally) misled
and the mouse reversion routine to malfunction. It copies without
any problems, though, and is indeed reset-proof.

Virus #41

Name: Bat Virus.
Type: Non-executable reset-proof memory-resident bootsector call
virus.
Discovery date: March 17th 1990 (George Woodside).
Virus can copy to drive(s): Current drive.
Virus attaches itself to: Hdv_bpb vector, timer vectors, reset
vector. Also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Last sectors of directory can be destroyed if the
directory is very long. The mouse pointer will turn into a batman
logo.
When does that happen: The directory bit can happen each time it
copies itself; the mouse pointer will change after one hour.
Reset-proof: Yes.
Can copy to hard disk: ?.
Remark: Written by some kid for a French journalist. He's an author
who has e.g. written articles about viruses, and he has probably
done this virus to check how fast they can multiply and to check
how good virus killers are. Previously, this virus was considered
to be 100% safe by ALL virus killers, as the bootsector is NOT
executable - yet it is a bootsector virus! It is really a very
ingenious viruses, but the "Ultimate Virus Killer" is ahead of its
prey!

Virus #42

Name: Grim Reaper Virus.
Type: Memory-resident bootsector virus.
Discovery date: May 9th 1990 (John).
Virus can copy to drive(s): Drive A only.
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: Yes (0.W $6A38, 3A.W $41FA).
Immunizable with UVK: No.
What can happen: De-installs itself, screws up the screen, prints
garbage on the screen and writes to contents of memory at $78000
(screen address on half megabyte machines) to the first 20 sectors

of a disk, lethally corrupting bootsector, FAT and directory.
When does that happen: After 47 copies of itself are made.
Reset-proof: No.
Can copy to hard disk: No.
Remark: A nasty one, this virus. Its installation structure is
identical with George Woodside's Antivirus "VKill Guard". The
bootsector also contains the text " -= The Jumper strikes again =-
Pirates, the grim reaper draws near ".

Virus #43

Name: Megacunt V2.0 virus.
Type: Memory-resident bootsector virus.
Discovery date: December 1989 (Dave Moss).
Virus can copy to drive(s): Current drive (floppy only), and only
to immunized disks.
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Acid-colours will be on the background screen
colour, done by the level 4 interrupt.
When does that happen: After 20 copies of itself are made.
Reset-proof: No.
Can copy to hard disk: No.
Remark: Written by a chap calling himself Alcoholica, and only
copies to immunized disks (!crikey!). Several other versions of
this virus are believed to exist, but none have been sighted.

Virus #44

Name: Horror Virus.
Type: Non-executable reset-proof memory-resident bootsector call
virus.
Discovery date: August 23rd 1990.
Virus can copy to drive(s): Drive A.
Virus attaches itself to: Hdv_bpb vector, timer C vector. Also
undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Screen will switch colours, sound will be heard.
When does that happen: At a certain time after copying itself
five times.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: Written by a member of ULM from Luxemburg, for test
purposes. He did this early spring 1990. It has never been spread,
but he gave it to me 'just in case'. Previously, this virus was
considered to be 100% safe by ALL virus killers, as the bootsector
is NOT executable - yet it is a bootsector virus (see 'Batman
Virus')!

Virus #45

Name: DJA Virus.
Type: Memory-resident bootsector virus.
Discovery date: Summer 1990.
Virus can copy to drive(s): Current drive.
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: Yes (0.W $6038).
Immunizable with UVK: Yes.
What can happen: Message will be displayed on screen ("Du ar
smetted av DJA viruset Generatio....(generation number)") and
system will lock up.
When does that happen: After a fourth disk is found with the virus
on it (or any disk starting with $6038 - including immunized
ones!).
Reset-proof: No.
Can copy to hard disk: Yes.
Remark: Written in Norway or Denmark, as the text it prints means
"You are infected by the DJA virus" in one of these languages). A
good thing is that it does not copy to immunized disks - but
unfortunately these immunized disks DO trigger the 'destruction'
routine!

Virus #46

Name: TOI Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: November 10th 1990 (George Woodside).
Virus can copy to drive(s): Current drive.
Virus attaches itself to: Hdv_bpb and resvector; it is also non-
documented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Inverts the vertical mouse movements (just like
the "Ghost" virus which is it's previrus). After that, it also
toggles the bits of a random memory location (this leads to
unpredictable crashes and small things going wrong).
When does that happen: After five copies of itself have been made.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: An adapted version of the "Ghost" virus. The name comes
from the TOI programming group in Denver, Colorado, USA, who are
reported to be responsible for this one.

Virus #47

Name: Flying Chimp Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 15th 1990 (Les Neidig).
Virus can copy to drive(s): Drive A.
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Message will be displayed on screen ("Zapped by

Waldo the Flying Chimp!").
When does that happen: After it has multiplied itself five times,
or when it has had 20 bootsector accesses.
Reset-proof: No.
Can copy to hard disk: No.
Remark: Thought to have been written in the USA. Also known as the
"Waldo Virus".

Virus #48

Name: Reset Virus.
Type: Memory-resident bootsector virus.
Discovery date: Summer 1988 (Volker Shnitz).
Virus can copy to drive(s): ?.
Virus attaches itself to: Hdv_bpb, Hdv_rw and Hdv_mediach vectors.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: It writes a message "Ihr Rechner hat Aids" (German
for "Your computer has AIDS") on the screen and then freezes the
system.
When does that happen: Three hours after booting.
Reset-proof: No.
Can copy to hard disk: No.
Remark: Strangely enough, this virus will not copy itself when
you've got a cartridge installed with the word "Dent" at address
$FA0066.

Virus #49

Name: MAD Virus B.
Discovery date: December 1987 (Volker Shnitz).
Symptoms: See virus #2.
Remark: Published in a magazine called "Atari Spezial" (German),
and therefore also known under the name "Atari Spezial Virus".
This is the original MAD virus, which is exactly the same as MAD
virus A (which was spread the most) except for the offset of most
code. It was written by J. Schuppener, and it was published
towards the end of the year 1987 in the mentioned magazine. The
magazine now seems to be defunct, but the publisher used to be
CAV-GmbH, He�stra�e 90, D-8000 M�nchen, Germany.

Virus #50

Name: Ghost Virus D.
Discovery date: February 17th 1990.
Symptoms: See Virus #12 (Ghost Virus). This virus has a few
damaged bytes and will not work properly - may even crash.

Virus #51

Name: Ghost Virus E.
Discovery date: April 1991.

Symptoms: Principally it's the same as the Ghost Virus (#12), but
the symptoms are different. It does something with the vertical
blank queue and leaves the mouse alone. Unfortunately the precise
symptoms are unknown as the copies of this virus that were found
were both damaged.

Virus #52

Name: Ghost virus F.
Discovery date: April 1991.
Symptoms: See virus #12 (Ghost Virus), Unfortunately, there is some
corrupted code in the virus copy routine so that it can cause a
disk to be corrupted (the bootsector can be written wrongly, not
corrupting the actual data but making it inaccessible).

Virus #53

Name: Megaguru & Argo 2 Virus.
Type: Memory-resident bootsector virus.
Discovery date: June 22nd 1991 (Paolo Munarin).
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: At booting, writes the text "* MEGAGURU & ARGO 2
001 * ANTEPRIME ATARI E AMIGA PRESENTANO :" on the screen. When
things go 'wrong' the screen inverts and a bleep sounds.
When does that happen: At each disk with an executable bootsector
that is accessed - with the exception of disks that have the virus
on them.
Reset-proof: No.
Can copy to hard disk: No.
Remark: This virus is from Italy. It was found on a disk which
contained a text file from a hacker called Megaguru, who (quote)
"would like to swap Amiga and ST software". Even his phone number
was on it!

Virus #54

Name: Ghost virus G.
Discovery date: June 1991 (Kai Holst).
Symptoms: See virus #12 (Ghost Virus). This seems to be an adapted
version of the Ghost Virus, and the pre-virus to most recent
mutant Ghost Viruses (of which there are rather an absurd lot).

Virus #55

Name: Finland Virus.
Type: Memory-resident reset-proof bootsector virus.
Discovery date: Early July 1991 (Steffen Fischer).
Virus can copy to drive(s): A.
Virus attaches itself to: Hdv_bpb vector, resvector. Also
undocumented reset-resistant.

Disks can be immunized against it: Yes (executable).
Immunizable with UVK: Yes.
What can happen: Fiddling with the screen colours (this comes down to the green and white colours of the desktop being reversed when in colour mode).
When does that happen: After is has done each 12th copy of itself. The virus only copies to non-executable disks, or executable disks that have viral symptoms (i.e. other viruses and itself) or that have the word 'Boot' contained at hexadecimal offset $82 (any disk 'protected' by the boot program of the German PD virus killer "Sagrotan" has the word 'Boot' at this offset!).
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: This virus was coded by a chap called Toubab, on August 30th 1990. It got sent to me by two people almost at the same time after the virus was almost one year old! Both occurrences, however, were in Scandinavia (i.e. disks from Finland and Norway) so this leads me to believe it was written in Scandinavia. It was a real pain in the posterior, as it started with a longword '00000000' value, that lead the "Ultimate Virus Killer" to not finding it suspect!

Virus #56

Name: Ghost virus H.
Discovery date: August 5th 1991 (Harald Uenzelmann).
Symptoms: See virus #12 (Ghost Virus). This is principally exactly the same as the standard Ghost Virus, but someone apparently found it necessary to change the Branch into BLS instead of BRA - which has the same result when executed but which effectively caused it not to be recognized.

Virus #57

Name: Signum Virus C.
Discovery date: September 25th 1991 (Darren Laidler).
Symptoms: See virus #1 (Signum Virus A). This is exactly the same with regard to symptoms and the way it works. The only reason why it is basically different is that someone (probably someone in England) optimized it a bit, and some machine code instructions have been replaced by others.

Virus #58

Name: Joe Virus.
Type: Memory-resident bootsector virus.
Discovery date: November 25th 1991 (ACN).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb vector.
Disks can be immunized against it: Yes (0.W $4E71).
Immunizable with UVK: No.
What can happen: When it finds itself with a specific value in the

fourth and fifth byte, it will execute itself again, probably cluttering up the system.
When does that happen: When it finds itself again, and then every second time.
Reset-proof: No.
Can copy to hard disk: No.
Remark: As this virus has no particular characteristics, it was called "Joe Virus" as I was listening to Jimi Hendrix' "Hey Joe" when I disassembled it.

Virus #59

Name: Directory Waster Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: Unknown (Michael Schussler).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb vector, resvector; also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: First twenty tracks of your disk get destroyed (both side 0 and side 1!) When does that happen: After each twentieth copy it made of itself.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: The name is quite improper, as it destroys about 25% of a disk and not just the directory. Initially, this virus only installs itself on the standard reset vector. After the first reset, it bends the hdv_bpb vector and becomes reset-resistant in the undocumented way.

Virus #60

Name: Merlin's Mad Virus.
Type: Memory-resident bootsector programme.
Discovery date: Unknown (Mike Mee).
Virus can copy to drive(s): Not at all.
Virus attaches itself to: Nowhere.
Disks can be immunized against it: No need to immunize.
Immunizable with UVK: Not applicable.
What can happen: See the Mad Virus - it does the same things with the screen and/or makes a sound.
When does that happen: When booting with a disk containing this 'virus'.
Reset-proof: Not applicable (i.e. "no").
Can copy to hard disk: Not applicable.
Remark: This is no virus at all, but it has been classified here as Mike Mee sent it to me who classifies it as a virus in his "Professional Virus Killer" programme. It was written by Merlin the Welsh Wizard, and it's TOTALLY HARMLESS. It can not copy itself, and only fiddles around with the screen in the same

fashion as the "MAD Virus" after which it is called.

Virus #61

Name: Wolf Virus.
Type: Memory-resident bootsector virus.
Discovery date: February 4th 1991 (Carsten Frischkorn).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: BIOS vector.
Disks can be immunized against it: Yes (0.W $EB34).
Immunizable with UVK: No.
What can happen: RAM memory amount it halved (this does not imply you actually LOSE RAM, it just means that it makes the computer THINK it has less RAM!).
When does that happen: After the eighth generation is found.
Reset-proof: No.
Can copy to hard disk: No.
Remark: A rather nasty virus. For starters, it starts off with the bytes you'd normally find on an MS-DOS disk, i.e. all virus killers think it's an MS-DOS bootsector. Second, it fools the user by putting the message "Kein Virus im bootsector!" on the screen at booting. This is the boot message of the virus-free bootsector of the German virus killer "Sagrotan". It de-installs itself after three infections (i.e. your computer will think you've got 1/8th of your actual amount of RAM memory by then!).

Virus #62

Name: Ghost virus I.
Discovery date: October 5th 1991 (Frank Jonkers).
Symptoms: See virus #12 (Ghost Virus), Unfortunately, there is some corrupted code in the virus copy routine so that it can cause a disk to be corrupted (the bootsector can be written wrongly, not corrupting the actual data but making it inaccessible).

Virus #63

Name: Menace Virus.
Type: Reset-proof memory-resident bootsector call virus.
Discovery date: Spring 1992 (David of H-Street).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Xbios vector, Hdv_bpb vector and interrupt level 4 interrupt; also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Overwrites the bootsector of your floppy disk with a message in an Elfish language (Tolkien).
When does that happen: After having made ten copies ot itself.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: This virus uses TWO sectors on disk, sector 1 and 10. It's rather cleverly written and thought to come from Malta. Several

versions are believed to exist.

Virus #64

Name: Ashton Nirvana Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: Spring 1992 (David of H-Street).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb vector; also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Random sectors will be read from the current drive (including hard disk!) and written back with the word "ASHTON" in it. This obviously corrupts your media, at one sector per Hdv_bpb use.
When does that happen: Each time a floppy/hard disk is read from or written to.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: Perhaps this virus was written by the same person as the "Menace" virus. It's a nasty one as it can corrupt hard disks as well!

Virus #65

Name: Lietuva Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: Spring 1992 (Paragraph Headquarters).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Vbl queue, resetvector; also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Bootsector will be zeroed.
When does that happen: After the first eight copies of itself are made, and every six copies afterwards. A copy is made every time a disk's bootsector is read/written.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: Written by a chap in the former U.S.S.R. who now lives in Lithuania. It does not bend any actual system variable which makes it rather revolutionary.

Virus #66

Name: Signum Virus D.
Discovery date: March 25th 1992 (Volker Shnitz).
Remark: This is an optimized version of the original Signum A virus, which is also somewhat smaller in size. It is no longer immunizable with the standard Signum immunization (0.W $6038) but instead requires to be immunized with 2.W $07C4. This effectively

makes it impossible to immunize it with the "Ultimate Virus
Killer"...

Virus #67

Name: Zorro Virus A.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: June 1992 (P. van Zanten)
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_rw, Hdv_bpb, resvector and also
undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: System will lock itself.
When does that happen: After a specific number of copies are made.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: A very complex virus that evaded virus killers previously
by being recognized as an MS-DOS bootsector. It's heavily coded
and installs itself in memory in a very complex way. On top of
that it seems capable of installing differently coded versions of
itself so that per definition each copy of this virus differs from
all other copies of it.

Virus #68

Name: Zoch Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 1992.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb.
Disks can be immunized against it: Yes (0.L $5A4F4348, "ZOCH").
Immunizable with UVK: No.
What can happen: Text on screen (The Night Force Virus Breaker by
Zoch), and copies itself.
When does that happen: Text appears on installation. It copies
itself to all disk it is not on already.
Resetproof: No.
Can copy to harddisk: No.
Remark: To all intent and purpose this virus was written as an
antivirus. Unfortunately it copies itself across ALL bootsectors
it finds with the exception of ones it finds itself on. This
means that it will destroy any previous program in the bootsector,
whether needed or virus!

Virus #69

Name: Macumba 3.3 Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: February 1993 (Chris Brookes).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, undocumented reset-resistant.

Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The system freezes totally and abruptly.
When does that happen: After a specific number of copies have been made of itself.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: This virus also codes itself and also fakes to be an MS-DOS disk (just like the Zorro Virus). Quite naughty.

Virus #70

Name: Zorro Virus B.
Discovery date: February 17th 1993 (Kenneth Elofsson)
Remark: Virtually identical to Zorro Virus A, so refer to information given there. Only a few bytes have been changed.

Virus #71

Name: Beilstein Virus.
Type: Reset-proof memory-resident bootsector call virus.
Discovery date: March 16th 1993 (Volker Shnitz).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, Vbl_queue, Hdv_rw, Hdv_boot, Gemdos, Xbios, regularly reset-resistant AND undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen, and when: 1) It can delete specific files when these are loaded by the user. These files are 'SAGROTAN', 'MDISK', 'FCOPYIII', 'FCOPY3??', 'DISKUS', 'DISKDEMO', 'TED_???' and 'G_COPY', 2) It can clear partition "C" of your hard disk when the virus in memory discovers that you are trying to trace it (trace bit set, for example in a debugger), 3) It can create garbage on your screen, 4) Keyboard, mouse and joystick can be disabled, 5) Mouse movements can be inverted (like with the "Ghost Virus"), 6) Printer output can be corrupted, 7) Modem output can be corrupted, 8) A bomb error can be created, 9) The system can be frozen until you enter the password "Apokalypse", 10) Memory can be cleared, followed by a reset, 11) The first hundred sectors of a floppy disk can be cleared, and 12) It can delete a folder. These are quite an amount of things that can go wrong!
Resetproof: Yes.
Can copy to harddisk: No.
Remarks: This virus also codes itself and also fakes to be an MS-DOS disk (just like the Zorro Virus). On top of that it uses an ingenious system where bits of its code are swapped around and where different bootsector offsets are used to make things extra difficult. Even when not yet coded, there are at least 10 different versions that this virus can generate of itself. With coding added, over 650,000 versions of this virus can exist. But

that's not everything: The bootsector that was on the disk before it got infected (e.g. a virus free disk) is stored somewhere else and executed after the virus installs itself. This means that the message "this is a virus free disk" will STILL appear even after the disk has been infected! It is a very complex virus that, apart from the bootsector, uses four other sectors on disk that are marked BAD in the FAT to make sure they're not overwritten. The use of these four extra sectors enable the virus to be bigger (hence the many different destruction routines) and also allow it to buffer the original bootsector previously present on the disk. The last naughty bit about this virus is that, when it bends system variables, it supplies regular XBRA ID codes of popular harmless applications to itself (for example HABO, VREP, VIRA, CB2K, SBTS and WINZ). The "Ultimate Virus Killer" correctly recognizes it anyway!
This is without a doubt the most nasty virus yet. It was written by a student from Beilstein, a town in South Germany (hence its name). It has only been supplied to specific virus killer programmers and has so far not actually been spread as such. Let's hope it will stay that way!

Virus #72

Name: Temporary Madness Virus.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: March 16th 1993 (Volker Shnitz).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen, and when: Every 65536 vertical blanks (on colour that means about every 22 minutes) the mouse movement is inverted for about 10 seconds.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: In Germany, this virus is known as the "Mouse Coordinate" virus.

Virus #73

Name: Darkness Virus A (Nightmare of Brooklyn #2 'Darkness').
Type: Reset-proof memory-resident bootsector virus.
Discovery date: July 17th 1993 (Piotr Kowalczyk).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, undocumented reset-resistant, resvector, vbl_queue.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: It can write garbage on the first 9 sectors of a random track between 1 and 79. The first of those sectors will then contain the text between quotes mentioned above with 'Name'.

Additionally, the virus can screen black.
When does that happen: The disk track garbage writing happens every other 8 copies that it writes of itself. The screen blackening happens every 32768 vertical blanks (i.e. after about 11 minutes on colour monitors, about 7.5 minutes on monochrome).
Resetproof: Yes.
Can copy to harddisk: No.
Remark: First discovered in Poland. This virus uses an intricate coding method which, like other recent viruses, allows it to create hundreds of differently recognizable versions of itself.

Virus #74

Name: Small Virus.
Type: Memory-resident bootsector virus.
Discovery date: Autumn 1993 (Chris Brookes).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Nothing harmful actually. It has no destruction routine nor a trigger routine.
When does that happen: Never.
Resetproof: No.
Can copy to harddisk: No.
Remark: Named after the fact that it is very small, less than half the bootsector size. Only copies itself. Nothing else.

Virus #75

Name: Ghost Virus J.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: Autumn 1993 (ORQ Computer Group).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb and resvector; it is also non-documented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Most likely nothing. It is changed (or has mutated) so that it manipulated a wrong memory value. The mouse pointer Y direction is NOT inverted.
When does that happen: After copying itself 10 times.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: It is almost identical to "Ghost Virus A", much more than the other variants. It was discovered in Australia, and also known as "Silent Virus".

Virus #76

Name: Zorro Virus C.
Type: Reset-proof memory-resident bootsector virus.

Discovery date: November 2nd 1993 (Piotr Kowalczyk).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_rw, Hdv_bpb, resvector and also
undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: System will lock itself.
When does that happen: After a specific number of copies are made.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: Although it does almost exactly the same as Zorro Virus A,
it is much more different from it than Zorro Virus B. For starters
all its individual routines are interchanged, causing the uncoded
virus start to be quite different too. It also installs itself on
a different location in memory. This virus is believed to have
been done in Poland, which seems to indicate that all Zorro
viruses were coded there. It also goes by the name of "Wredniak"
(which is Polish for "Nasty Virus").

Virus #77

Name: Lucky Lady 1.02 Virus.
Type: Memory-resident bootsector virus.
Discovery date: February 1994.
Virus can copy to drive(s): Floppy drive A only.
Virus attaches itself to: Hdv_bpb and vbl queue.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: A message ("Lady Luck rules forever!") is printed
continuously on the screen, locking your system. A reset is the
only way out.
When does that happen: After about an hour (on monochrome 70 Hz) or
an hour and fifteen minutes (colour 50 Hz).
Resetproof: No.
Can copy to harddisk: No.
Remark: Coded by a female programmer who goes by the name of Lady
Luck of Sector MP Inc. from Ljubljana, Slovenia (in former
Yugoslavia). She has initiated some sort of bizarre 'war', and has
vowed to write many more viruses to test both her talent at
writing them and my talents at killing them. She sends her latest
creations to me by registered mail without specification of the
sender. Nothing more is known about her, other than that she
studies at Ljubljana University. This virus is actually prettily
clumsily written, and used to get a VPF of 220% because it used
three separate instances of "rwabs", among other things. I have
mixed feelings about all this, and all I can say is that I'd love
to kill her creations softly.

Virus #78

Name: Lucky Lady 4.12 Virus.
Type: Reset-proof memory-resident bootsector call virus.
Discovery date: March 1994.
Virus can copy to drive(s): Floppy drive A only.
Virus attaches itself to: Hdv_bpb, resvector, vbl_queue.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: 1) It puts message "Lucky Lady forbids you to load the UVK!" on screen, then erases "UVK_x_x.PRG" files from current drive when you try to load the "Ultimate Virus Killer" 2) Mouse cursor is changed from TOS arrow to Lucky Lady's logo (LL) 3) Screws up the screen 4) Logical clusters 351 & 352 are overwriten and marked as 'bad' in the FAT (Every cluster entry after 351 is thus a "floating entry" if there was a file (data lost) present before on a disk).
When does that happen: Message and UVK file erasing happens every time you want to load the "Ultimate Virus Killer". Mouse cursor is changed after approximately 35 minutes on monocrome (a bit longer on colour). Clusters 351 & 352 are lost during cloning i.e. during every drive A access.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: Like "Lucky Lady 1.02", this virus is written by a girl from Slovenia as part of her bizarre 'war' (see previous virus remarks). It's not called "Luckly Lady B" and the other one "Lucky Lady A" because the viruses are totally different despite their similar name. This virus is much more complex and also a lot more dangerous. It seems only to work on English versions of TOS 1.00, where the file name of the file currently being loaded is at a specific location.
News is that this Sector MP Inc. has set up a virus coding school in former Yugoslavia. Things are beginning to get out of hand.

Virus #79

Name: Anaconda Virus A.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: February 1994.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, resvector and also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The virus seems to be designed to print a message on the screen, "MAUI viens de vous niquer" (this means something like "MAUI has just made fun of you"). However, there is reason to believe it will in fact get fed a bogus text address and will thus print garbage instead.
When does that happen: After 10 successful copies are made of itself, and after that after every 5 copies.
Resetproof: Yes.
Can copy to harddisk: No.

Remark: Virus is located at $140, but after the first reset it relocates to phystop-$8200. It is believed to have been written by the Replicants, a cracking group from France, but this is in no way certain. The text seems to indicate a French origin anyway.

Virus #80

Name: Lucky Lady Virus 1.03.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: April 1994.
Virus can copy to drive(s): A.
Virus attaches itself to: Hdv_bpb, undocumented reset-resistant, resvector, vbl_queue.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The message "Lucky Lady's your empress" appears on screen after which your system locks up.
When does that happen: Virus activates itself after approximately 80-110 seconds; the system will lock itself somewhere between 45 and 65 minutes.
Reset-proof: Yes.
Can copy to hard disk: No.
Remark: Like the other viruses of a similar name, this was written by a Slovenian girl calling herself Lucky Lady. It cleverly disguises itself as an "ST Format Cover Disk" - the virus is a personal revenge against writer Clive Parker - and is Falcon-compatible.

Virus #81

Name: Anaconda Virus B.
Type: Reset-proof memory-resident bootsector virus.
Discovery date: Spring 1994.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, resvector and also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The virus prints the text "AKO-PADS" on the screen. Also, the virus will corrupt the disks it copies itself to.
When does that happen: After 10 successful copies are made of itself, and after that after every 5 copies.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: This is either an adapted version of Anaconda A, or the other way around. There is no way to proof either. The virus is also known as "Ako Pads" virus.

Virus #82

Name: Pashley Virus.
Type: Memory-resident bootsector virus.
Discovery date: December 4th 1993.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Screen flashing red. The virus will copy itself across all non-executable bootsectors.
When does that happen: The flashing happens each time you boot with an infected disk in the boot drive.
Resetproof: No.
Can copy to harddisk: No.
Remark: Contains the texts "VIRUS KILLED BY S.C.PASHLEY" and "ENGLAND" which are never printed on the screen. Hence the virus name. Virus bootsectors are actually left alone by the supposed anti-virus as they are normally executable. Maybe this virus was written by S.C.Pashley, but probably not. It is *not* an anti-virus because it copies itself and does nothing against viruses as such.

Virus #83

Name: Gotcha Xeno Virus.
Type: Reset-proof memory-resident
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, resvector and also undocumented reset-resistant.
Disks can be immunized against it: Yes ($1E.L $263C0000).
Immunizable with UVK: No.
What can happen: The virus will write garbage, headed by the text "GOTCHA!" on random tracks (1-64) and sector (0-7), thus damaging data.
When does that happen: After 10 successful copies are made of itself, and after that after every 5 copies.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: It is unclear whether this is actually the Pre-Virus of Anaconda, or perhaps just another virus developed from it. Some of its characteristic (such as the fact that it fully works and that it can principally be immunized against) warrant classifying it as a separate virus.
The reason that it can not be immunized against by the "Ultimate Virus Killer" despite location $1E not being occupied by any other bits of the immunization scheme is that, officially (i.e. according to Atari's standards), bootsector programs should not start prior to offset $3A. To rule out possible problems, I decided to avoid it altogether.

Virus #84

Name: UVD Virus.
Type: Potentially reset-proof memory-resident bootsector virus.
Discovery date: October 1994.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb *or* hdv_mediach.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The screen will display a text. Depending on its configuration it can lock up the system afterwards.
When does that happen: After about 45 (monochrome 70 Hz) to 65 (colour 50 Hz) minutes.
Resetproof: Depends on its configuration.
Can copy to harddisk: No.
Remark: This is a series of viruses that can be created by the "Ultimate Virus Designer", a program written by the Slovene Stonewashing Organisation. It claims almost 200 different versions of this can be made, depending on various configurable parameters such as "offset", "resetproof yes/no", "hide behind MS-DOS header yes/no", "location in memory", "attach to hdv_bpb or hdv_mediach" as well as two different 'destruction' routines or 'no' destruction routine. All these versions can be recognized.

Virus #85

Name: Tiny Virus.
Type: Memory-resident bootsector virus.
Discovery date: September 1994.
Virus can copy to drive(s): Floppy drive A only.
Virus attaches itself to: Hdv_bpb and vbl_queue
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Nothing. This virus just copies itself.
When does that happen: Well...never.
Resetproof: No.
Can copy to harddisk: No.
Remark: This is the smallest virus so far, occupying only 34% of a bootsector. It was written by Lucky Lady.

Virus #86

Name: Kobold #2 Virus B.
Type: Memory-resident reset-proof bootsector virus.
Discovery date: October 10th 1994 (Dejan Orehek).
Virus can copy to drive(s): A (?).
Virus attaches itself to: Hdv_bpb and resvector, vbl_queue; also undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The message "I LOVE JADRANKA" appears on the screen.
When does that happen: Upon installation.
Resetproof: Yes.

Can copy to harddisk: No.
Remark: This is an adapted version of the Kobold #2 Virus, which will henceforth be known as Kobold #2 Virus A. The destruction routine was removed so all this virus does it copy itself and display that message at startup. The text message is encoded within the virus with a hexadecimal decoding value of $21111968, which would lead to thinking that November 21st 1968 is the birth date of either the author of Kobold #2 Virus B or this mysterious girl, Jadranka.
This virus is probably of Balkan origin, and might be as old as from 1991.

Virus #87

Name: Signum Virus E.
Discovery date: September 19th 1994 (Mike Holmes).
Remark: This is a corrupt version of the original, with a different branch offset and faulty startup code, most likely leading to a system crash upon installation. It cannot multiply effectively.

Virus #88

Name: Macumba 5.2 Virus.
Type: Memory-resident reset-proof bootsector virus.
Discovery date: August 1994.
Virus can copy to drive(s): A or B (current drive).
Virus attaches itself to: Hdv_bpb and undocumented reset-resistant.
Disks can be immunized against it: Yes (executable or 0.L $EB909047).
Immunizable with UVK: Yes.
What can happen: This is not exactly known. Probably a crash?
When does that happen: Probably not too long after a reset.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: To my shock, I ran across a collection of "Macumba Virus" installation and recognition files, leading to the following conclusions. First of all, it's written by someone from the Netherlands. Second, there are at least *19* different versions of virus (0.9, 0.9a, 1.0, 2.0, 3.0, 3.1 TT, 3.2 TT, 3.3 TT, 3.4 TT, 3.5 TT, 3.6 TT, 3.7 TT, 3.8 TT, 3.9 TT, 4.0 TT, 4.0b TT, 5.0 Falcon and 5.2 Falcon). It seems we are dealing with some TT compatible and Falcon compatible viruses here. Viruses 0.9, 0.9a and 1.0 have bugs in them, so might not work/multiply properly. I am currently trying hard to get my hands on the versions that are not yet recognised by the "Ultimate Virus Killer" (i.e. all of them with the exception of 3.3 TT and 5.2 Falcon).

Virus #89

Name: Vaccin-Gillus Virus.
Type: Memory-resident reset-proof bootsector virus.

Discovery date: August 18th 1994 (Mike Holmes).
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, resvector, and undocumented
reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: Prints the text "VACCIN-GILLUS" on the screen
whilst showing wobbly colour thingy bars.
When does that happen: At booting with an infected disk.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: This was probably supposed to be an anti-virus, or at least
to look like one. It copies itself right across any other
bootsector, however, and does not work against any other viruses.

Virus #90

Name: Valkyrie Virus.
Type: Memory-resident reset-proof (?) bootsector'n'link call virus.
Discovery date: Late 1994.
Virus can copy to drive(s): Current drive (A, B or C). Can also
copy via LAN or MIDI networks.
Virus attaches itself to: Xbios and vbl_queue.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: A variety of things. The part of this particular
version that was found will cause the "Kobold #2" Virus to be
found on a disk upon reading the bootsector, and the "Lucky Lady
1.03" to be written when writing to the bootsector.
When does that happen: During bootsector access.
Resetproof: Not known.
Can copy to harddisk: The virus as a whole can, but this particular
segment only affects floppy disk drives.
Remark: This virus has not been properly encountered. The UVK does
not recognise it on disk but only recognises the segment that
attaches itself to the XBIOS vector, when the virus is already in
memory. See also at end of this file.

Virus #91

Name: Goblin Virus B.
Discovery date: May 1995.
Remark: See Goblin Virus A (#19). The only thing changed about this
version if the initial branch code, now preceeded by a longword
zero, with an adapted BRA. This virus, together with the next two,
was sent in one batch by someone anonymous who probably made these
variations himself. They all have in common that only the branch
commands have been modified, effectively disabling them from
recognition by the UVK so far.

Virus #92

Name: Tiny Virus B.
Discovery date: May 1995.
Remark: See Tiny Virus A (#85) and Goblin Virus B (#91). The branch was changed to a NOP followed by the regular branch, adapted.

Virus #93

Name: Darkness Virus B (Nightmare of Brooklyn #2 'Darkness').
Discovery date: May 1995.
Remark: See Darkness Virus A (#73) and Goblin Virus B (#91). The branch was changed to BPL.

Virus #94

Name: Pharaoh Virus.
Type: Memory-resident reset-proof bootsector call virus.
Discovery date: Spring 1996.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, resvector and undocumented reset-resistant.
Disks can be immunized against it: Yes, though it is not known exactly how.
Immunizable with UVK: Very likely. It copies to none of the immunized disks I tried to have it infect.
What can happen: Noise is made, as well as a high frequency sound.
When does that happen: After five copies have been made.
Resetproof: Yes.
Can copy to harddisk: No.
Remark: A particularly devious virus, which uses two 32-bit random values to double-encrypt itself. It can also start at 13 different locations in the bootsector, and the initial instruction can be one of 2048 different ones. This results in a total of (2^32) * (2^32) * 13 * 2048 different versions that it can make of itself (when multiplied that's 4.9112611*10^23...). It is also MS-DOS mimicking.
It was sent to me anonymously, with an Arnhem (Netherlands) postmark. The virus is Falcon-compatible but does not copy to high density disks. As it fiddles around with BPB FAT values, programs such as "FCopy" and "Knife ST" may fail to operate properly on infected disks because they may find the manipulated BPB values hard to swallow.
It is also known as "The Curse Virus" or "Klatwa Virus" (this is Polish for "Curse", and was used to make it appear as if it was written in Poland).
Disks once infected with the "Pharaoh Virus" will never be completely regular because of the virus having rearranged various values in FAT and BPB. Copy all files you need to retain off them, then perform a soft or hard format, and copy the files back.

Virus #95

Name: Carpe Diem Virus.
Type: Memory-resident reset-proof bootsector virus originating from

a Trojan Horse.
Discovery date: Spring 1996.
Virus can copy to drive(s): Current floppy drive (A or B).
Virus attaches itself to: Hdv_bpb, resvector, vbl and undocumented reset-resistant.
Disks can be immunized against it: No.
Immunizable with UVK: No.
What can happen: The text "BO[BJOF" appears at the top left of the screen. Your computer can crash.
When does that happen: The text is displayed 2048 vertical blanks after system start-up (on a 50 Hz colour monitor that would be after about 40 seconds). The crash can (and will) happen any time after that.
Resetproof: Yes.
Can copy to harddisk: Yes, but only in a file form ("~.PRG", see below).
Remark: This virus has an interesting history. It originally came in a ZIP archive called "CARPDIEM.ZIP". It contained a file called "CARPDIEM.PRG" (normally 91,750 bytes in size) and a small text file with the contents "Sease the day, and run this great falcon enhanced game!!" (sic). Upon running this 'game', nothing would appear to happen (though a quick eye would see the text "Ruth Marcs Development Inc. (Dedicated to the memory of Lucky Lady)" flicking on and off the top of the screen). The 'game' wouldn't run, and the desktop would be displayed again. The virus, however, would have installed itself in memory and on the current floppy disk, and would have written the "~.PRG" file (see below) in C:\AUTO\. Useless, the "CARPDIEM.ZIP" file and related items would be thrown away. So this virus actually arose from what is commonly known as a "Trojan Horse". Even if you'd get rid of all virus occurrences on floppy disks, the "~.PRG" file would reinstall it on floppy every time you reboot. Likewise, the floppy version of the virus would reinstall the "~.PRG" file! So it is quite impossible to let the "Ultimate Virus Killer" on its own completely get rid of the virus for you.
HOW TO PROPERLY GET RID OF THE "CARPE DIEM VIRUS".
You have to remember that, on an infected system, there are a potential number of three copies of the virus: One on your floppy disk, one in the hard drive C:\AUTO\ folder and one in memory. These are the steps:
1) First you have to reboot without a disk, or with a disk that is guarenteed to be virus free. Turn your system off for half a minute. This will get rid of two of the possible three copies of the virus in your system (in memory and on floppy). Make sure the floppy disk is write-protected.
2) Turn your computer back on. Press [CONTROL] during the booting process. This way - at least with the Atari hard disk driver - the hard disk will be installed and accessible, but the programs in the \AUTO\ folder will *not* be executed. If you have another hard disk driver installed, simply try to bypass hard disk installation

altogether (pressing [CONTROL], [LEFT SHIFT] and [ALTERNATE] simultaneously usually ought to do the job) and install the hard disk driver from floppy. This, too, will not install any of the \AUTO\ folder programs. If you have a Claus Brod hard disk driver installed, all you need to do is simply boot off another partition, like D:.
3) Now you have to get rid of a file called "~.PRG" in the \AUTO\ folder of hard disk partition C:. It can't be located anywhere else. Unfortunately, the file is hidden. That means you can't delete it until you can see it, and you can't normally see it. There are probably quite a few ways to delete it:
i) With "GfA Basic". Go into "direct mode", "chdrive" to drive C and "chdir" to the \AUTO\ folder. Now, with "files", you can display the full directory, including hidden files. You can now use the "kill" command to delete "~.prg".
ii) With the alternative file selector "Selectric". Turn the "display hidden" option on, and simply delete the file from "Selectric" itself. "Selectric" can be started from the desktop, without needing to start it from the AUTO folder. You might have to switch to a higher resolution first, though.
iii) In the absence of the two options mentioned above, you can use any command line interpreter (such as "COMMAND.PRG"). These may not allow you to delete the file, but this is no problem. Using the "ren" command you can rename the file, for example to "file.xxx". This will not remove the file from the \AUTO\ folder, but will render it completely harmless - after all, only programs with the "prg" extension are executed when the \AUTO\ folder is invoked.
4) Now, with a clean and uninfected system, you can get rid of all occurrences of the virus on all your floppies with the "Ultimate Virus Killer".
IMPORTANT: The floppy-based version of the "Carpe Diem Virus" is recognised without further ado. To recognise the tiny (1024-byte) "~.PRG" file from the link virus check (both the "CARPDIEM.PRG" mother file and the "~.PRG" file are recognised, regardless of what name they might currently have) you have to set the lowest limit of the link virus check to 1 Kb (this will cause only files below 1 Kb not to be scanned). By default, this value is set to 3 Kb, which would cause the "~.PRG" file to be skipped. The lowest link virus check limit can be altered by means of the "UVK.CNF" file (see the appropriate manual section). A line containing ".001" (without the quotes) added at the end of the file (using a text editor, for example) will do the job.

Virus #96

Name: Mad Virus D.
Discovery date: Autumn 1996.
Remark: See Mad Virus A (#2). This virus version could be written by a "Bootsector Re-Installer" utility (by Tronic of Effect, alias of John Cove). The difference is that it is located at an extra

offset of $1C bytes from the beginning of the bootsector.

Virus #97

Name: Kobold #2 Virus C.
Discovery date: Autumn 1996.
Remark: See Kobold #2 Virus A (#16). This virus version could be written by a "Bootsector Re-Installer" utility (by Tronic of Effect, alias of John Cove). The difference is that it is located at an extra offset of $1C bytes from the beginning of the bootsector.

Virus #98

Name: Signum Virus F.
Discovery date: Autumn 1996.
Remark: See Signum Virus A (#1). This virus version could be written by a "Bootsector Re-Installer" utility (by Tronic of Effect, alias of John Cove). The difference is that it is located at an extra offset of $1C bytes from the beginning of the bootsector.

LINK VIRUSES

Virus #1

Name: Milzbrand.
Type: Non-resident non-overwriting link virus.
Discovery date: Spring 1988 (Wim Nottroth).
Symptoms: When the date stamp is set to 1987, it clears track 0 of your floppy disk, destroying all FAT data and filling the bootsector with a message "Dies ist ein Virus!" ("This is a virus!"). Also, it display six "viruses" on the screen. Symptoms can vary because the virus was offered as a, fully documented, type-in-listing (!) in the German mag "Computer & Technik" and the reader could easily adapt the routines himself.
Remark: This virus was written by Eckhard Krabel, who lives in Berlin, Germany. The editorial address of C'T Magazine is Verlag Heinz Heise GmbH, Helstorfer Str. 7, Postfach 61 04 07, D-3000 Hannover 61, West Germany. Telephone (Germany) (0)511/5352-0. It's also called "Anthrax Virus" (which is English for the original name in German).

Virus #2

Name: Virus Construction Set Part II.
Type: Non-resident non-overwriting link virus.
Discovery date: September 4th 1988 (Frank Lemmen).
Symptoms: These vary from the message "You have ten seconds to find out how to prevent a reset" (after which a countdown follows and a reset) to routines that can be written by the user himself - the "Virus Construction Set" is a programme with which the user can create his own viruses! Symptoms are therefore without limit!

Remark: The "Virus Construction Set Part II" was published by GFE R. Becker KG, Knigsteiner Str. 76, D-6232 Bad Soden am Taunus, West Germany. It used to be for sale at 80 German Marks, but isn't any more.

Virus #3

Name: Uluru.
Type: Memory-resident non-overwriting link virus.
Discovery date: November 1988.
Symptoms: Installs itself in memory but is not reset-resistant. It infects every programme that will be started once an infected programme has caused it to be installed, and only does this on drive A or B, and on files that are at least 10,000 bytes in size. After a certain time, it writes a dummy text file on disk when infecting a file. This text file contains the sentence ";-) As MAD Zimmermann will be watching you )-;".
Remark: Also called "Mad Zimmermann Virus", for obvious reasons.

Virus #4

Name: Papa & Garfield.
Type: Memory-resistant reset-proof non-overwriting link virus.
Discovery date: November 1988.
Symptoms: This is a reset-proof virus, that installs itself in memory when an infected programme is loaded. After that, every other programme that is loaded into memory is infected. It can be recognized by a flashing pixel in the left top corner of the screen and the message "Garfield and Papa was here", preceded by a bleep sound.
Remark: Probably only works on one megabyte machines (or higher) since it uses the absolute screen address $F8000.

Virus #5

Name: Crash.
Type: Memory-resident reset-proof non-overwriting link virus.
Discovery Date: March 20th 1989 (Claus-Peter Moeller).
Symptoms: A reset-proof virus, that also installs itself in your system and then infects every programme you load in afterwards. Is

only active on the current drive, but can copy itself into any folder. It can even infect files that have been immunized with the "Ultimate Virus Killer".
Remark: Probably programmed in Switzerland.

ANTI-VIRUSES

An Anti-virus is a small programme that works just like a virus, but that doesn't format your disk, clear FAT sectors, lock up the system or do anything of the kind. Instead of doing evil things, it e.g. warns you when it finds an executable disk in the drive (it can then for example start bleeping and flashing). This is a good

way to find out if a disk has an executable bootsector or not
(which does not mean that it has or hasn't a virus!). For First Aid
help, anti-viruses are quite neat. They also copy themselves to
other disks (not to hard disk), except when these already contain
an executable bootsector (in which case they warn you).

Anti-virus #1

Name: AntiVirus.
Remark: There are sixteen different versions of this AntiVirus,
which were all written by Helmut Neukirchen. The following table
includes them all. They are all recognized by the UVK, and the
English versions of 5.1 can be written using the 'REPAIR DISK'
option. The texts vary slightly and are not specified here. None
of them copy to hard disk, and none of them are reset-proof.
* Version 3.0GB
Discovery date: August 8th 1988.
Written on May 3rd 1988.
Symptoms: On system boot-up, a message appears on your screen:
"This Anti-virus beeps and flashes if the actual bootsector is
executable then that might be a virus! Remove this Anti-virus by
reset!" It multiplies itself to other, non-executable floppy
disks.
* Version 3.0NL
Remark: This was a simple translation job by yours truly.
* Version 4.0
Written on August 21st 1988.
* Version 4.1
Written on September 21st 1988.
Remark: Also recognizes IBM disks on which it does not copy
itself.
* Version 4.2
Written on September 21st 1988.
Remark: A version of 4.2 that does not copy itself to other disks.
* Version 4.5
Written on October 18th 1988.
Remark: There are German and English versions of this AntiVirus.
* Version 4.6
Written on October 18th 1988.
Remark: A version of 4.5 that does not copy itself to other disks.
* Version 4.8
Written on December 5th 1988.
Remark: Uses XBRA structures, completely reprogrammed.
* Version 4.10
Written on May 19th 1989.
Remark: Calls itself 'VirusLhmer'.
* Version 4.11
Written on June 24th 1989.
Remark: A version of 4.10 that does not copy itself to other
disks.

* Version 5.0
Written on May 12th 1989.
Remark: This was a version released by mistake, and actually older
than 4.11.
* Version 5.1
Written on April 23rd 1990.
Remark: There are cloning and non-cloning versions of this
AntiVirus, each in in a German and an English version. Recognizes
mutation, and recognizes disks that are immunized using the UVK.
* Version 5.2
Written on ?
Remark: Helmut has in the mean time stopped developing the
AntiVirus.

Anti-virus #2

Name: Antivirus #2.
Discovery date: September 10th 1988.
Symptoms: On system boot-up, a message appears on your screen at
the top line: "ANTI-VIRUS". It multiplies itself to other non-
executable disks, except when it's already present on them. When
an executable bootsector is found, it inverts all colours and
bleeps.

Anti-virus #3

Name: Antivirus User V1.4.
Discovery date: May 30th 1989 (Carmen Brunner).
Symptoms: Installs itself in memory and warns you when it finds
certain disks: RED = Virus 1 (Signum Virus), PURPLE = Virus 2 (Mad
Virus), BLUE = Bootsector, WHITE = Nothing. It multiplies itself
to WHITE disks on drive A only. Its virus recognition is very
bad, and many other disks are also suspected of being RED or
PURPLE - including perfectly harmless ones.
Remark: Written by someone called Le Fele.

Anti-virus #4

Name: Antivirus #4.
Discovery date: June 28th 1989 (Wim Maarse).
Symptoms: This antivirus is reset-proof. It probably only works on
German Blitter TOS (TOS 1.02 version from 22.04.87), since it uses
an absolute ROM jump address to the Get_BPB routine of that TOS.
It copies to other disks.

Anti-virus #5

Name: Terminator V1.0.
Discovery date: March 1990.
Symptoms: Does not copy itself, and is reset-proof. Automatically
checks disks for executable bootsectors, and checks memory for
resident programmes.

Remark: Written by Claus-Georg Frein for a commercial copy
programme called "Turbobooster".

Anti-virus #6

Name: Pashley Antivirus.
Discovery date: January 18th 1990 (Terry Simmons).
Symptoms: Copies itself to other disks, and will flash the screen
and beep when an executable bootsector is found.
Remark: Written by Simeon Pashley.

Anti-virus #7

Name: Powell Antivirus.
Discovery date: July 30th 1989 (George Woodside).
Symptoms: Does not copy itself to other disks. Will bleep and
flash the screen when an executable bootsector is found.
Remark: Written by virus killer programmer Mark S. Powell.

Anti-virus #8

Name: The Killer V2.0.
Discovery date: March 18th 1990 (George Woodside).
Symptoms: Does not copy itself. Gives out messages in French when
executable bootsector is found.
Remark: Written by Emmanuel Collignon/Omikron France.

Anti-virus #9

Name: VKill Guard.
Discovery date: May 14th 1990.
Symptoms: Does not copy itself, yet installs itself in memory and
flashes and beeps when executable bootsectors are found. Its sign-
on message is 'This Guard remains active until reset. If it
detects an executable bootsector, it will beep and flash the
screen.'
Remark: Written by George Woodside for his programme "VKill".

Anti-virus #10

Name: New Order Antivirus 1.02.
Discovery date: May 22nd 1990 (Glenn Robison).
Symptoms: Prints message and locks up the computer when a virus is
found to bend a bector. It checks the following vectors: Hdv_init,
Hdv_bpb, Hdv_rw, Hdv_boot, Hdv_mediach, BIOS and XBIOS.

Anti-virus #11

Name: Floppyshop Antivirus.
Disovery date: April 29th 1990 (Kevin Brown).
Symptoms: Beeps and flashes the screen when an executable
bootsector is found that doesn't contain itself. Doesn't multiply.

Anti-virus #12

Name: Protector II Antivirus.

Anti-virus #13

Name: Incoder Antivirus.
Discovery date: July 1990.
Symptoms: Checks the bootsector for the occurrence of the Hdv_bpb address ($472). Checks if Hdv_bpb points at $FCxxxx or not (will therefore imply something is wrong when you work on an STE, ST Book or when you use a hard disk). If things are wrong, it colours the screen and locks the system. If things are OK it will print "The Incoders - safe boot" and flash one colour.

Anti-virus #14

Name: Auntie-Virus.
Discovery date: Summer 1990 (David Heiland).
Symptoms: Same as Anti-virus #1. Only the texts have been changed.
Remark: Probably made in England.

Anti-virus #15

Name: Shadow Antivirus.
Discovery date: July 1990.
Symptoms: Checks the system for reset-resistant programmes in memory on boot-up. Not resident, does not copy itself.
Remark: Written by the Shadow of the Dynamic Duo, England.

Anti-virus #16

Name: Fury Antivirus.
Discovery date: August 24th 1990.
Symptoms: Same at Antivirus #13, of which it is an adapted version.
Remark: Made by Fury of Legacy (ex-Replicants).

Anti-virus #17

Name: Unicorn Anti-Virus-Reset Antivirus.
Discovery date: December 11th 1990.
Symptoms: It is a resident programme that will clear all reset vectors upon reset.
Remark: Probably written in Holland.

Anti-virus #18

Name: Zarko Berberski Antivirus.
Discovery date: Unknown (Mike Mee).
Symptoms: There are two different versions of this. One copies itself and one doesn't. They both have the additional ability to wait 'x' seconds until the hard disk has finished booting.
Remark: Written by Zarko Berberski from what used to be Jugoslavia.

Anti-virus #19

Name: Odie Antivirus.
Discovery date: Unknown (Mike Mee).
Symptoms: Puts a picture of Odie (dog character in Garfield cartoons) on the screen. Is resident, and checks for executable disks. It will copy itself on non-executable disks, and it will warn when it finds an executable disk that does not have itself on it (the screen is turned red).
Remark: Uses the XBRA protocol.

Anti-virus #20

Name: TDT 4.0 Antighost.
Discovery date: June 1992.
Symptoms: Is a resident antivirus that copies itself across a bootsector that it finds the Ghost virus on.
Remark: Written by Altair in France.

Anti-virus #21

Name: Caledonia Exorcist 2.0.
Discovery date: December 1992.
Symptoms: At startup it will put the message "Caledonia Exorcist 2.0" on the screen. Whenever an executable bootsector is found during it being resident in memory, it will warn you. At any time you can press ALT-HELP to have this antivirus install itself on the current disk. It will not copy itself without you wanting it to.
Remark: Written for/by the Caledonia PD library. The copy routine crashes on my system. Not to be confused with some virus free disks of the same name made by some French hackers.

Anti-virus #22

Name: Agrajag Boot 2.
Discovery date: July 1993.
Symptoms: At startup it will put the message "AGRABOOT 2" on the screen. Whenever an executable bootsector is found while it is present in memory, the screen will flash. It will flash RED when such a bootsector is suspicious. Upon starting it will also find reset-proof programs and the like. It will not copy itself to any other disks of its own accord.
Remark: Written by Michael James from Glasgow, autumn 1992. Quite a good Anti-virus actually.

VIRUSES KNOWN TO EXIST BUT NOT RECOGNISED BECAUSE NOT ENCOUNTERED YET

Unknown virus #1-#17: Macumba Virus

Several different versions of the Macumba Virus (Cf.) exist, none of which have been spotted so far and can therefore not be recognised yet. The following versions are known to exist but cannot be recognised: 0.9, 0.9a, 1.0, 2.0, 3.0, 3.1 TT, 3.2 TT, 3.4 TT, 3.5 TT, 3.6 TT, 3.7 TT, 3.8 TT, 3.9 TT, 4.0 TT, 4.0b TT and 5.0

Falcon.

Unknown virus #18: Valkyrie Virus

This is an especially dangerous hybrid kind of bootsector/link
virus that spreads to hard disk files, floppy disk bootsectors and,
via LAN or MIDI networks, even to other systems connected. It hides
itself effectively, and there are a few versions of it that have
varying destruction routine symptoms. The common denominator was
that, on January 8th (birthday of its programmer, Lucky Lady from
Slovenia), the screen would clear and the message "I will never
love again!" would appear on the screen. A system infected with the
Valkyrie Virus will have a partition C volume name with "VLKY"
encoded in it; files infected with it have "VLKY" as last longword
value.
In memory, it is partly recognised by the UVK.

: anywhere I can get one or is there a belt from something else (audio
: equipment,etc.) that I can use to replace it?

: Thanks!

As an accident of geography, I get such things from Detroit Ball Bearings.
Any vendor of bearings and seals for machines has o-rings, one of which
will be a good enough fit for the job. That is where I get rubber things
to repair audio equipment, and bearings and bushings to fix disk drives.

Look in the phone book under "bearings", and go there, old part in hand.

I have never got this to work 100% - I got the batch files to work OK
eventually, but my system does not seem happy with ppp2.2.0f. It fails diring
the PPP configuration/negotiation phase waiting for a response to something. I
am running fine with the TAF ppp2.1.2 - based system and a minix FS.

So, to rephrase the question a bit, is anyone running ppp2.2.0e/f successfully?

>Any help?
>Thanks,
>Dave B.

Hmm...I've used DE2 on my Falcon on SCSII and IDE drives for 3 years
now with great success. I also use HD Driver (4.6). (As well as
previously using DE2 with ICD Pro and AHDI).

Are you trying to Optimize the drive when it tells you that the boot sector is
unrecognizable? You should be in the disk medic menu, and when testing
the partition, it asks you if you want the boot sector rebuilt.

If this doesn't work, I'd say that your drive is toasted! :-(
You do make backups, don't you?

Diamond Back 2 is excellent for making backups-especially with Syquest
or Zip drives. Once you define the options for a backup set, a couple
of mouse clicks is all you need to do an unattended backup. I backup
the files in the uncompressed state. This way, if a program gets
corrupted, a backup can be easily copied from the Syquest EZ135 drive
in a few seconds/minutes. Because it's so quick and easy, I backup
daily. Believe me when I have had a whole drive die, it's nice to just
restore the backup. Better than pulling hair out!

Good Luck! :-)

Well, I use the LAN ports with MiNTNet and with CoNnect and never have any
problems. So, in my experience, the LAN port _is_ as easy to use as any
other serial port.

>Can someone clue me in as to the HD situation with an Atari?
>
>(1) Is that a SCSI port on the back of the thing? Can I use my old SCSI
>external drive from my Mac?

That's Atari's own custom posrt for their hard drives. You need to get
ICD Link to use any SCSI device.

>(2) Would I be able to use a Zip Drive instead?

If it's SCSI, then see above... :)

>(2.1) If so, is an Iomega Driver available? I've not seen one on my
>travels.

Last I heard, Hi-Soft were making drivers for the ST. Someone may have
better info.

>Also, I've got a 3.5" DD that is formatted to just over 800K - yet when
>I format using the OS, I only get about 706K of space. I need to back up
>the 800+K disk (which has 805K of (crucial)) files on it!

>Any method of formatting to 810K or something?

There are alot of formatting programs that will format up to the space
you want. They let you choose from 80 to 82 tracks and 9 or 10 sectors.
Go 81 tracks and higher, then there's a chance the drive will ruin the
disk. I say go with 80 tracks and about 10 or 11 sectors.

Hi There,

Thing Icons file can be edited using INTERFACE works a treat. I use
this to edit all resorce files and modify Icon files.

Regards

>it used to be one of my favorites...

I have a copy of Joust I can send you through e-mail if you want. It used to be a commercial release by Atari but now the game's PD. It is very much like the arcade version with even better looking background graphics. This port really gives the one on Williams Greatest Hits a run for it's money, and 'that' is the actual arcade game! :)

Nice.

[deletia]
>Oh, come on. The point is that it's there if you need it. I'd rather
>have VM around so that I don't have to worry nearly as much about running
>out of memory.

If your OS is 'modern', running out of memory shouldn't be a problem.

If, on the other hand, it is likely to go down in a ball of flames:
then it's a problem.

>
>> Virtual memory was developed in one context and then applied to another.

>> who know and understand the issues involved.
>
>I would be very surprised, based on your postings, if you had much of a
>grasp of computer architecture. If you do, you sure aren't using it.

I have enough to know that SCSI fast wide (or even RAID) doesn't quite
compare to multiple IO channels or solid state disk.

Furthermore, such knowledge really isn't required. All that I have
said can be demonstrated empirically with no technical understanding
needed.

[deletia]
>You're really exxagerating the performance hit quite well. I congratulate
>you on your use of polemics.

Then I challenge any interested parties to test for themselves.

8ms is a lot faster than 150ns no matter what kind of spin you
try to put on things.

[deletia]

>>
>> Two words: Resin Fire.
>
>And what the hell is that non sequitur supposed to mean?

It means that some of us have been doing this for awhile and
have actual empirical knowledge of the subject that trumps
quite a bit of what academia may be feeding you. It's a shame
they don't quite feed you enough.

>
>Oh, wait, I get it. You're trying to make an obscure and clever reference

Amongst memory consumers, the reference is by no means obscure.

>to the scare that artificially inflated memory prices a while back.
>Unfortunately, as a response to the point I was making, it falls flat on
>its face.

Money is never irrelevant. Perhaps this is the reason Mac is in its
current state. When I got my first ST, you could buy a new car for
less than some Macs. They're trapped in an academic mentality and
aren't capable of real engineering.

We are just fortunate that RAM doesn't impose the same kind of
constraints that it once did. To believe that it never will again
to the same extent is grossly naive.

>
>>>So what's your point? That we should stay mired in the backwaters of

>There are many things which cannot be grafted at the application level.

Like What?

[deletia]
>Does it have VM? No? Well, that's an obvious start. Does it have much

It's a poor start. VM is not at all necessary. In microcomputers,
it only serves to allow developers to be immensely sloppy.

Memory Management would be a much better 'modern' requirement.

>in the way of network support? No? Does it have memory protection? No?

Actually, MagiC does. Network support can exist on the application
level and has been existent on the ST's for quite some time.

>Sounds like a limitation to me. (Maybe things have changed, but in my
>Atarian days there was little to no support for any of these things, and I
>haven't seen evidence of them in my fiddling with MagiCMac.)

I'll consider this methodology the next time I fire up the PC
Mac emulator: Executor. '-p

>
>Does TOS have a 3D graphics API? Does it support hardware acceleration
>for it? MAJOR limitation. This is hardware of today we're talking about.

API's are all applications level.

Although 3D hardware acceleration would be a nice addition.
However, this could also be added to TOS with no problems.

NVDI-3D.

>
>Does TOS have anything like QuickTime?

For those parts of QT that actually get used: yes.
Although, this is applications level as well.

Someone told me there is a nice set of gadgets out of France...
The one that sounds like a winner to me is the Centek board.
I've heard it's in the $300 or less price range...will fit inside
the regular Falcon case, boosts the CPU, DSP, VIDEL, and the BUS speeds
all four to somewhere around the 25mhz mark. It's supposedly compatible
with all Falcon software from CuBase to Apex Media/Expose. Also heard
you can easily put a Nemisis on top of this if desired. Sounds like
a great option for the mid-range user who would like to use the higher
resolutions occasionaly without slowing the system to a crawl or adding
a $400 Nova card. If you compare the price of this one board with
the costs of putting a power-up and a Screen blaster (both slightly faster
but no BUS increase) you come out about the same...but get a bit more
performance due to the BUS speed up.

Now...if I can find out where to get this from here in the US.
Keep your eyes peeled...someone here in the news groups who is fluent
in French is looking into a way to get the Centek in the US. Hopefuly
an English order form and install docs are on the way :)

If you can read French, I saw a text file on ftp.cnam.fr called Centek.
It might have order information on it...I tried, but couldn't read it,
so I've no clue what it says!

Yep..They had a loss but managed to increse their cash on hand. There will
always be a need for an alternative to Wintel. Apple needs to solve thier
manufacturing capacity problem with the PowerBooks and get those out. This will
be done by mid Feb. Hooper will do well, but fear it will be supply
constrained and Apple's PowerBook backorder will shoot up to $2 billion.

> And Apple owns Power stock, so that's beneficial for them too.

I wasn't aware of this. Power is privately held and may go public this year.

I have some web pages about the Afterburner 040 upgrade, you can
find them at http://www.rjelwell.demon.co.uk/ab040.html

There is info there about the afterburner mailling list, software
compatibility etc.

I will hopefully be fitting a Nemesis soon and I will post a
similar review to the pages afterwards.

Nemesis speeds up the existing FPU. For such a small layout it
might be worth fitting an FPU just to see if the speed is
acceptable to you.

Rich.

As a serial port, yes. But so far I haven't been able to actually use
the LAN port as (ta-da!) a LAN. It seems incredibly stupid to have to
use MIDIcom at 31k bps when I have a pair of TT030's and should be
able to link at 115k or faster!

# 1244. Read Atari-diskettes (1.44) on DOS-PC

Newsgroup: comp.sys.atari.st
Date: 1997-01-20 00:00:00 UTC
From: roehl@erzicip.erzwiss.uni-hamburg.de
Message-ID: <5bvetu$bgd@rzsun02.rrz.uni-hamburg.de>
Source record: 129624

Hallo,

does anybody know a shareware-program that can read Atari-diskettes
from a Atari ST (1.44 MB) on a DOS-PC?

Thanks for any help!

AFAIK, it should work on all STs, though I've only tried it on the
Falcon. It does require MagiC though.

Martyn

## 1248. Newsie & Demon

Newsgroup: comp.sys.atari.st
Date: 1997-01-20 00:00:00 UTC
From: awood@f030.demon.co.uk
Message-ID: <853764120.6521.0@f030.demon.co.uk>
Source record: 129628
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

When using Newsie v0.66 with Demon's news service (the standard one - not pub or beta) all the subscribed to newsgroups are renamed 'up'.

This only started happening a short while back - but a similar thing happened when Demon introduced their betanews news server. It too would rename all the newsgroups to 'up' - the main server at that time would leave the names unchanged.

What this all comes down to is that you have a list of subscribed to newsgroups in the window, all called 'up' - if you open one you get a listing of the available articles for what should be the group - but if you try and open another it doesn't work and about three bytes are loaded and then you get a blank window.

I'm using a Falcon030 TOS 4.04, with Stik 1.12 and Newsie 0.66

Any help or comments gratefully received!

Regards,
Andrew

You better get HD-Driver. The best hd driver available on the Atari and
it has alot of utulities to do this.

> If I go with Linux can I dual boot? Can I start up Linux at will and
> still be able to run TOS apps?

I'm not the right person to ask about this, but you will be able to run
TOS applications under Linux in the near future and probably even GEM
apps (using the GEM interface).

> Do I have to make a boot disk for TOS in case I crash my HD. I don't
> even know how to boot from a floppy! :-(

This is easy. Press 'Alt' while booting (I think.. I don't do this very
often) with a disk inserted in the diskdrive. Pressing 'Control' while
booting the computer will boot without any Accessories and will not
run the programs in the autofolder or read the newdesk.inf file. Good
if you have got some bad programs in the autofolder which makes your computer
crash at bootup. This will let you remove them as they wont be runned.

> What is the best way to backup the files on my Falcon? Do I need to get
> a Jaz drive or would a SCSI tape be better? What ever I get I will want

Brian Hutchinson <hutch@ena-east.ericsson.se> writes:

>
> I've seen a few messages on the news group about BlowUP FX,
> Afterburnner 040 and a Nemisis or something like that.

Well I have got an Afterburner040 and I'm waiting for an
Nemesis. :-)

If you want real speed there is only the Afterbruner040. It's
expensive but it's worth it as it's fast and you can have up to
64MB Fast-RAM (32-bit) of ram plus your regular 14 MB ST-RAM
(16-bit) making a total of 72 MB RAM. There is no card which
can match this.

The FX is okey, if you manage to get it running properly and then,
it's usually at 36/18 (CPU/BUS) MHz and costs farily much. The Nemesis is
about 1/4 of the price of a FX and boosts the computer to 24/24 Mhz.
I would say that if you want fast graphics your would get the
Nemesis. The only advantage the FX has towards the Nemesis is that
you can add more than 14 MB ST-RAM on the other hand you could get
the Magnum memory card with the Nemesis and you would get that as well
and cheaper and it would probably be more stable. Not sure if the
Magnum will work at 24MHz bus speed though. It does work at 20MHz.

> What is the best upgrade for the Falcon? I'd like to get or
> be directed to some information so I can check these upgrades
> out.

You can check out this web pages (they will be updated some day...)
http://rand.thn.htu.se and then check out the Afterburner040 pages.

> I would also like to hear from anyone who has these upgrades
> to evaluate personal testimony regarding speed, price, and
> compatibility.

Well the Afterburner is rather expensive, but there isn't anything
to compare with it speed wise.

Compatibility is suprisingly high. About everyting you want works on
it, if you doesn't count some games ofcourse, but even they often
works. It's much more compatible then a Hades.

> I want to get a 882 FPU so I can run Linux (I know about the
> kernel with emulation) faster but I don't want to spend
> 50 or 60 bux on it when the upgrade I'm interested will
> probably have one anyway.

If you are going to use Linux the Afterburner040 is the way to go.
It's _much_ faster than on the AB040 than on any other Falcon
accelerator and the RAM can be rather handy when running Linux to
say atleast.

> Please post to this news group so others can get the info

If you want to keep the files small, you should probably look elsewhere than PDF files. In my experience, PDF files are even more bloated than PS files, which isn't surprising since, as I understand it, PDF files are PS files with the font descriptions added in. This is why Ghostscript is able to interpret PDF files with ease. That said, any portable document format will be large. You'll probably find that compressed (monochrome) bitmaps like GIF or IMG will be smaller than a corresponding PS file.

Linux on the same machine does not maintain foreground response in the
face of 100% CPU usage nearly as well. (Linux crashes a lot less often
too, but then it's a much more mature OS than BeOS.)

Oh, come on. The point is that it's there if you need it. I'd rather
have VM around so that I don't have to worry nearly as much about running
out of memory.

> Virtual memory was developed in one context and then applied to another.
> This is a simple matter of computing history and architecture for those
> who know and understand the issues involved.

I would be very surprised, based on your postings, if you had much of a
grasp of computer architecture. If you do, you sure aren't using it.

Here, you carp that VM was designed for big iron, that it's inappropriate
for a small machine. In a word, your claim is BS. The machines UNIX and
VAX VMS originated on are blown away in raw CPU power, memory size, disk
size, and disk bandwidth by a modern personal computer. About the only
thing our small boxes lack compared to the big guns of yesteryear is
enough aggregate I/O bandwidth to handle lots of simultaneous user logins
from terminals.

You're really exxagerating the performance hit quite well. I congratulate you on your use of polemics.

In reality, VM performance hits are not the step function you suggest. You do not go directly from 100% performance to 5% or worse. There are a large number of situations where VM is active without impacting performance much at all. Sure, if you get your computer into thrashing behavior, performance will go to hell, but that's a characteristic of any caching system. Modern computer architecture is all about memory hierarchies and avoiding thrashing behavior between the various levels. VM is no different.

>>server to have decent performance, you must put enough RAM in it so that
>>it doesn't have to swap often, or else users will complain that the
>>machine is a slug).
>
> Two words: Resin Fire.

And what the hell is that non sequitur supposed to mean?

Oh, wait, I get it. You're trying to make an obscure and clever reference to the scare that artificially inflated memory prices a while back. Unfortunately, as a response to the point I was making, it falls flat on its face.

>>So what's your point? That we should stay mired in the backwaters of
>>computing just to be absolutely guaranteed that a disk swap operation will
>>never happen?
>
> So? How is TOS a backwater? One has yet to address that. All you
> MacVocates can come up with are application level toys.

Ah, so now I'm a MacVocate. Funny, I don't seem to recall this thread, or at least my participation in it, being about the Mac for quite some time now.

For the record, I have many beefs with the MacOS. I own a Mac, partially because it's the last hope for non-Wintel personal computers, but I am not uncritical of it.

> However, since Petey-Boy himself seems to think that the OS is just
> a pathway to the apps,

I don't care what Peter thinks. You're not arguing with Peter. You're arguing with ME.

> then great OS sophistication really isn't

> of these limits is not addressed by MagiC 4.0?

Does it have VM? No? Well, that's an obvious start. Does it have much
in the way of network support? No? Does it have memory protection? No?
Sounds like a limitation to me. (Maybe things have changed, but in my
Atarian days there was little to no support for any of these things, and I
haven't seen evidence of them in my fiddling with MagiCMac.)

Does TOS have a 3D graphics API? Does it support hardware acceleration
for it? MAJOR limitation. This is hardware of today we're talking about.

Does TOS have anything like QuickTime?

Hello,

Well, the subject-line says it all. The Belgian Atari User Group A4 keeps an atari info day on Sunday 26 January 1997 in the Palaestra in Deinze. Several other Atari User Groups will be present. And also a few companies. Here you have the list :

Atari Computer Club Leopoldsburg
Atari Computer Club Mechelen
Atari Computer Club C&T Antwerpen
Compocom
Byttebier Printing Services
Multi Vision - CENTEK
Compu-net
Electro-line
Midi Comï¿½die
N2000 (Ville Neuve d'Arcq)
Studio Capital (Paris)

If you're interested and you want to come, check out this page to find a map, or mail me (before 22 jan 97) or <Martin.Byttebier@ping.be>.

http://193.190.205.13/Popo/148_pol/Samyn/rechts.htm

I hope we will see you there...

Norm,

If you have an E2 prom storage cartridge for the esq-1 let me know
(for writing sounds not sequences).

# 1264. NEW: free Atari ST emulator for MS-DOS

Newsgroup: comp.sys.atari.st
Date: 1997-01-20 00:00:00 UTC
From: brasoft@coho.halcyon.com
Message-ID: <5c0jaj$fgh$1@brokaw.wa.com>
Source record: 129644

Emulators Inc. has just released updated versions of our free Atari 8-bit and Atari ST emulators for MS-DOS, OS/2 Warp, and Windows 3.1.

GEMULATOR CLASSIC version 3.6 is the latest Atari ST emulator which replaces Gemulator 3.02. We ported over a bunch of bug fixes and 68000 speed optimizations from the Windows version of Gemulator, making Gemulator Classic 3.6 run noticably faster than Gemulator 3.02 and earlier versions. Still requires only a 386 with 2 meg or more when running on MS-DOS, or 8 meg when running in a Windows 3.1 or OS/2 DOS prompt.

Download it from the Emulators web page at http://www.emulators.com.

You can also download a demo version of Gemulator 96 version 4.6, the latest Windows version of Gemulator, which runs about 30% faster than Gemulator Classic and adds a ton more features. Gemulator 4.6 has been benchmarked at double the speed of MagiC PC, which using less than half the disk space. Check it out!

- Darek

Sorry, Brad, but Michtron BBS is /far/ from complete. It can't run external programs, has no Fido-compatability so it can't be used in a networked BBS, and is frankly very slow and limited.

Currently-supported BBSes include (but are not limited to) Octopus (my favorite), QBBS-ST, RatSoft, possibly ST-Keep (Andrew STuder comes and goes, depending on his workload in Real Life). Others that are still available are Foresight, Transcendence, STadel, Fnordadel and a heap of other similar room-based systems.

Hej Magnus,

the tests were all carried out with Nemesis set at 24 MHz (ie. the CPU and bus @ 24 MHz and the DSP and FPU @ 48 MHz). And yes, the Falcon is perfectly stable like this.

>
>For a privat user i think the FX-Board are the best way.
>Easy to fix, not expensiv, standard 30pin simms.
>and compatible with all my software.

Unfortunately not all of us have found this to be true. My
fx installation runs ok for about 1/2 hour before causing
a system crash. I did run across one program that just wouldn't
run with the acceleration - and no, it was not a game, but I
forget now which program it was. (I just run things like that
on a different machine.) Actually, I should be more precise -
it wouldn't run with fx set to 36 (never could get 40 to run
on my falcon for more than about 1 minute) but ran ok with it
at 32 (ie no acceleration).

So I have a falcon that sometimes runs at 36MHz with fx but only
for about 1/2 hour before the overheating (my guess) causes it
to crash. I guess overheating because having a fan blow on the
falcon will let it run longer before the crash.

In 32MHz mode, (actually either mode) I don't really have access
to all my memory since the memory code was never finished. Don't
look at this solution as a memory upgrade. Wayne

PS- My installation was professionally installed.

The only disk-based TOS that was made available to the public was TOS 0.98;
this was included with the very first run of 520ST and 20ST machines. With
the advent of TOS 1.0 on ROM, only developers had legal access to disk-based
TOS versions (which is not to say they aren't around, just that it's illegal
to sell them or give them away).

# 1271. Kivi QWK 2.00

Newsgroup: comp.sys.atari.st
Date: 1997-01-20 00:00:00 UTC
From: ajalkane@alpha.hut.fi
Message-ID: <5c0fhd$hck@nntp.hut.fi>
Source record: 129651
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.announce

I have uploaded the new version to ftp.funet.fi a couple of hours
ago. I hope it's available from there in few days.

Here is what is new:

Kivi QWK history...

v2.00 20/01/1997
==========
+ Kivi can now load and show several packets at the
same time. The loaded/available packets will be
shown in "Window" menu under <Packets>. Clicking
on the packet will read the packet and open window,
or top packet's window if it's already open.
Closing the main window will close all windows
occupied by the packet and free the memory it used.
When loading a packet Kivi will create a subdirectory
under your work directory (named after your QWK
packet's name) and create work and reply directories
there.
+ Coded a new GEM library for Kivi and redesigned
the dialogs to use it. Improvements:
- hotkeys in dialogs
- iconify under MultiTOS
- some nice external objects
- scrollbar ability in views
- unlimited number of windows open if
OS/memory allows
+ Every packet may have it's own configuration. If
no packet is loaded, and you configure Kivi, a
so called Default configuration is used. This
configuration is used if the loaded packet doesn't
have it's own configuration saved. When saving
configuration Kivi will ask, if it makes sense,
if you want the configuration to become the
"Default" configuration or this packet (BBS) specific.
Of course this question comes only if you save
options when a packet is open, otherwise Default
options are saved. Notice that some options are
shared among all configurations. These are work
directory, packer paths and editor paths.
As a result of this feature, KIVI.BBS file
is useless, but I left KIVI.BBS working for
compatibility. This will however probably be

removed in future.
+ Toolbar icons added. At the moment only mono
icons, as I couldn't get colour icons working :(.
The icons are in top of the read window. There
are icons for (from left to right) Open packet,
pack replies, write message, reply, edit, list
own, print message, next/prev message, next/prev
area, jump to message, find string, bulletins and
BBS information. You can enable/disable the toolbar
from Options - Window. Thanks go to Magnus Thylander
for drawing these fine icons!
+ You can mark messages for reading/replying etc.
Just mark the messages you want to read later, and
select Read marked. A new window is opened where
all the messages you selected are shown. You can
then do what you want with the messages.
+ Killfile ability included. If you don't want to
see the messages from some person/to some person/
about some subject, just add it to killfile. The
killfile is named KIVI.KLL, or BBS_ID.KLL, where
BBS_ID is the BBS ID of the BBS you want the
killfile to apply to. The killed strings are
separated by spaces, and every string that is
found from the killfile and the packet's To,
From or Subject fields is excluded.
+ You can select a part of message (or bulletin)
to include in the quote, export/print etc..
To select a block just push the left mouse button
and grab the area you want to select. The selected
area is inverted. You can expand the selected area
by pressing down shift and pushing mouse button where
you want the selection to be expanded.
+ List own opens it's own window.
+ There is "Clear workdir after" and "Clear workdir before"
in Options - General. If Clear workdir before is selected,
the workdir of current packet (the packet that is in top
when Open packet is selected) is cleared before the new
packet is loaded. If this is selected Kivi will behave
almost like the old versions, displaying one packet at
the time. If Clear workdir after is selected, the workdir
of the current packet is cleared after Pack replies.
+ If you press control down and click a menu item, Kivi
will try to display help about that menu item by calling
ST-guide.
+ You can define the colours for Marked messages and messages
that are addressed to you in Options - Colours.
+ Scrollbars in Bulletins and Options - Font. The scrollbar
is realtime.
+ Some keys changed to be more "standard". Most notably
Load packet is change to Open packet and the key from

Control-L to Control-O.
+ The alerts are displayed in windows and they have hotkeys.
+ When sorting by subject, subjects with "Re:" in beginning
are treated equal with subjects that don't have it.
+ Many bugs corrected, many bugs added ;).
+ I'm sure I forgot something.

# 1272. Re: Q: From WK1 or LDW to *.STS

Newsgroup: comp.sys.atari.st

On 20 Jan 1997, Steve Hammond repplied to my post:

>> I have LDW power that makes *.LDW files. There's a conversion PRG
>> that converts them to *.WK1 (lotus) but Atari Works cannot read it as
>> spreadsheet files. Is there any conversion PRG that does this? From
>>*.LDW or WK1 to *.STS or something that the Works can digest? ;).

> The only way that I can think of is to save the file as a ASCI
> text file. If you print the LDW file to disk, it will
> give you the ASCI text file. AtariWorks can then import that. You will
> lose all of the formatting, but at least the numbers will still be
> there.

> Steve Hammond

Indeed it worked but, I am interested in taking all the formulas
to the Atari works. Ascii doesn't matter too much because it's a new
year. (The spreadsheet I'm talking about handles my budget and transactions,
so I need only the formulas ;).

Best Wishes:

Message-ID: <5c0osr$4tc@thoth.nilenet.com>
Source record: 129653

Theodore L Hopman (thopman@uoguelph.ca) wrote:

: format will be large. You'll probably find that compressed (monochrome)
: bitmaps like GIF or IMG will be smaller than a corresponding PS file.

Theo, I did some tests with GIF. I printed my docs from Pagestream using the IMG print driver set at 300dpi. They were then converted to GIF using Gemview. The resultant files were large (370k IMG files converted to 290k GIF files).

I did that because there are fine details in the docs that would be missed at lower than 300dpi "real dots" printed resolutions. Of course, the GIFs have to be printed with an option like "fit to page" for this resolution.

The PS files that I create (uncompressed) are about half the size of the GIFs (if I only have one font). I would still like to try and get the PDFs to work. Adobe Distiller is getting a "definefont" error and barfing. This seems to be the only problem with the conversion.

John

Hmm...if its a SC1224 compatible plug, you can use the SC1224 video adaptor,
and if its a standard VGA plug then you can use the VGA adaptor. What kind
of cable plug does it have? Later... ;)

Seagates are almost bullet-proof. Give it a try - if it doesn't work, I'll
eat it!

Seriously, just ask the seller if you can return it if your host adapter
can't handle it. My experience with Seagate SCSI drives is, ANYTHING can
handle them - even Atari host adapters.

>.

I ask about this same problem a few months ago and never got an
answer. I think I know what it is. I was using a 30 meg cache and
the delay grew very long. After loading each new page, CAB seems to
be writing an index file in the top directory of the cache. As the
size of the cache increases, the index has to be bigger, so the write
takes longer. You can control the time of the delay by changing the
size of your cache. This is just my guess from looking at the
problem. Hope this helps.

# 1282. Re: Newsie & Demon

Newsgroup: comp.sys.atari.st
Date: 1997-01-20 00:00:00 UTC
From: awood@f030.demon.co.uk
Message-ID: <5c0v12$rrm@usenet.bham.ac.uk>
Source record: 129662
Cross-posted to: comp.sys.atari.st,demon.ip.support.atari

In reply to R.T.s suggestion to check the default files for the newsgroups,
it was the first thing that I did!

I have even set up a separate folder to hold default files so that when
the one in the working folder gets destroyed, I always have a back-up.

Unfortunately as it now stands, every time I connect to Demon's new news
server it always gets ruined.

(The one in the working directory that is, not the back-up!)

As for the log file, is appears that Demon is sending 411 group not available
for each of the groups - but at the same time with NOS I gettingNNTP Bad
reply on banner (response was -1 {or} 400) - so maybe Demon's
newly configured News server is to blame (and would that be a surprise?)

Regards,
Andrew Wood

Take a look in the NEWSIE folders for the DEFAULT.GRP file - view it and see
if all the groups have been renamed there as well.

If they have, delete the file - it's worthless now. Resubscribe to the
desired groups.

Hi all!

I've read from Atari Computing's P.D. and Shareware pages
about the following interesting titles:
- Maggie 20;
- CPU MOD;
- Appline 2.1E;
- Start me up 1.10e;
- Croft Soft Disk Mag.

So, where can I find them (URLs, FTP sites etc...).
Then, anyone can tell me if the following games: 'Running'(Doom clone),
'X Moon', 'Painium Disaster' and 'Johnny the adventurer' (Rayman
clone) all for Falcon 030 was finished and available?
Are there any new titles for Falcon?
Thanks for your answers.

Greetings,
Rosario Pignatelli - Italy

Hi,

I have an Atari SLM804 laser printer for sale.

300x300 DPI / 8 Pages per Minute
Plugs into DMA port of the ST or TT030
Drum installed is in fair condition
Extras included with printer are a drum (not great),a new sealed toner,
and SLMC804 ASCI controller.
Comes with manual, SLMC804 controller and I can supply a disk of SLM utilities

Asking $100

g> therefore banished from the real good keyboards?)

AIUI whichever keyboard is used is compatible with all three machines. The
original MegaST one with the ports in the way you described and the TT/MSTe
one. It seems you just got whatever was available at the time.

>> Do you have the phone-jack type of connections at both ends of the
>> keyboard lead? I think that's the only difference. Mine only has one
>> at the computer end B^{<
g> The keyboard-to-computer cable is fixed into the TT keyboard, and has a
g> phone-line plug on the other end. However, the MegaST keyboard had a
g> detatchable (and losable) cable with a plug on each end to connect
g> keyboard and system unit. And the supplied one was a tad short.

I see - the same as mine. I was told that the TT one was detachable at both
ends, but it seems the are variants. The cord at the keyboard end of mine is
worn and I'd have liked to convert that end to a phono plug if I'm able.

g> (BTW: This discussion should really be taking place in the "Keyboards"
g> thread, as there has been 100 1rift from the original topic of this
g> thread)

I can't see a Keyboards thread, so I've just changed this one...

>I received as an e-mail attachment. Is there something for the Atari that
>will unMIME it if I d/l it from my internet provider?

Yes, Esscode will do it, but what a pain..... :-(
I've managed to do it a couple of times, but I can't really remember how I did it.
I *think* this was the way I did it:

-loaded the MIME decoded file into a text editor and removed everything above and below the MIME'd file itself.
-Had a look at what the file's real name was after decoding (it says in the 2nd or 3rd line from the top of the MIME file- i.e. "7up209.zip")
-I went into the "MIME decode" menu and immediately got the file-selector.
-I entered the name of the file as it should be when un-MIME'd (i.e. "7up209.zip") and pressed [Return]
-I double clicked the MIME file itself, and (hopefully) the un-MIME'ing process will start!

** PS. I found it a *very* smart idea to make a backup of the MIME file as I've experienced many times having to experiment trying to make it work, and if you do this the wrong way the decoded file will write over the MIME file. So by having a backup copy of it you can just try it again..
Good luck!

* Correct me someone if I'm wrong about the above procedure!

You can download Esscode from:

ftp://ftp.sn.no/user/hallvart/atari/esscod64.zip (77 Kbytes)

# 1300. Want to Convert Pagestream PS to Adobe PDF

Newsgroup: comp.sys.atari.st
Date: 1997-01-20 00:00:00 UTC
From: jnorton@nilenet.com
Message-ID: <5bv5tp$1at@thoth.nilenet.com>
Source record: 129700

I would like to convert Pagestream Postscript files (PS) to Adobe's Acrobat format (PDF). Does anyone have experience with the PDF format and with programs like Adobe's Distiller? Any Pagestream users done a successful conversion?

I don't have a DOS or Mac computer, so I can't even experiment. But, I can send the files to anyone who wants to take a try at it!

The reason that I want to convert the files to PDF is that I am sending the files to people who not only have Atari's, but other PCs and mini's as well (DOS, Mac, Unix machines, etc.).

The files are a set of plans and are meant to be printed (not just viewed on screen). I am using IMG and GIF right now, but I want to try to improve the printed resolution and still keep the files small. I also understand that PDF files produce exact duplicates of the original PS files (as far as resolution goes).

Thanks!

John Norton

Marc Fotheringham wrote this to All about Atari storage questions - please help... I'm going nuts!:
MF> (1) Is that a SCSI port on the back of the thing? Can I use my
MF> old SCSI external drive from my Mac?

There is a DMA-port, where you plug in a SCSI-interface (Link-II from ICD or Hard&Soft).
With these interfaces, any SCSI-HD can be used. Avoid new Quantum drives which need "bus-arbitration", since you won't be able to use them at all (if you don't get the new Link-96, which is more expensive).

MF> (2) Would I be able to use a Zip Drive instead?

No problem. The only thing to think of, is that the SCSI term-power is too weak to provide power to the interface, so you'll have to provide this from another HD that's connected after the Zip, or with a cable from +5V in the computer (available at the joy-port or serial port) to the term-power pin in the Zip's second SCSI-connector.

MF> (2.1) If so, is an Iomega Driver available? I've not seen one
MF> on my travels.

If you want to use the password and write protect on the Zip, you should use HDDriver, but if you don't need these functions, any driver will do.

Best regards,

Claes

Some older versions of the atari boot disk included TOS right on the disk
for booting purposes. The file is calles TOS.IMG. I think TOS 1.2 and 1.4
were the only versions to be included on a diskette.

What an excellent posting! Brought a tear to my eye. I never did know what happened to Atari. It makes you kinda sad. My first computer was an Atari, a 600Xl. I still have it, though I upgraded a long time ago to a 800XL that still beats me at chess weekly.

> as a 32-bit unsigned integer - standard UNIX format time... same as TOS
> file time-stamps...)

Nope. Unix uses "Seconds since January 1, 1970". And that will overflow
in 2038. (I can't recall the actual date or time-of-day that will happen,
though)

TOS file stamps are 16-bit values made up of three bitfields: year, month
and day. The day field is 5 bits wide, giving a range of 0-31. The month
is 4 bits wide, giving a range of 0-15. This leaves 7 bits (16-4-5) for
the year.

The largest unsigned integer that can be represented in seven bits is 127.
The year field is biased relative to 1980. So 1997 is represented as year
17. This field will overflow (and go back to "year zero" 1980) in 2108
(1980+128)

However, if the year field is signed, it then has a range of -64 through
+63. That gives it the ability to store years 1916 to 2043.

> > can't deal with the years 2000+, and there are thousands of accounting

Hi pettert@notam.uio.no, on 18 Jan 97 you wrote:

p> I have been given an Archive Maynard 2000 DAT player - an internal
p> SCSI device and I'd like to use it for backup purposes on my Falcon.

Lucky!

p> Does anyone know if some software exists for controlling the thing?
p> I know there's a program from Soundpool called DataDat, but I'm not
p> sure if this will do the job.

Well, SCSI is SCSI so I would guess that any tape streamer s/w should handle it apart from, perhaps, a few configuration parameters which are special to this transport.

Why not have a go with GEMAR - it is shareware but the demo version does most things.

.. OR Diamond Back v3+ - this is definitely commercial but there are demos around if you want to try it out.

Steve Sweet uses some sort of DAT device - perhaps he will reply to your call for help :)

Hi mykle@con2.com, on 19 Jan 97 you wrote:

m> Is there defragmenting software and virus software for Atari hard
m> drives?

I use ZORG as my hard disc tool - try it, there are PD demos around.

..OR .. the ancient Atari CHKDSK3 defrags OK. It is not very happy with
replacement operating systems, though.

It does not look for viruses though. I think you need to use Richard
Karsmaker's UVK prog. for this. The thing with virus killers is that they
require constant updating to cope with new virus strategies. Richard provides
this.

From: shammond@loop.com
Message-ID: <5bum5t$o6v@jerry.loop.net>
Source record: 129716

Hell-o:

I have LDW power that makes *.LDW files. There's a conversion PRG
that converts them to *.WK1 (lotus) but Atari Works cannot read it as
spreadsheet files. Is there any conversion PRG that does this? From *.LDW
or WK1 to *.STS or something that the Works can digest? ;).

Phil,

The only way that I can think of is to save the file as a ASCI
text file. If you print the LDW file to disk, it will
give you the ASCI text file. AtariWorks can then import that. You will
lose all of the formatting, but at least the numbers will still be
there.

> If I use Howfast the results are totally different..

Different programs always yield different results. This is because the
way the programs test the transfer speed often differs substantially.
You must not compare results from different programs. Stick to one
program and compare the results.
For my own part I always use SCSITOOL to measure drive speed.

This is not a question of reliability but of the way these programs
work. The manual or README will tell you how such a program measures the
drive's speed and these methods differ. Without information on how the
measurement is done any result is useless.

## 1320. WMF 2 GEM and/or CVG needed

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: Ramiro Tellez Sanz <rtellez@filabres.ualm.es>
Message-ID: <Pine.A32.3.91.970121210818.35864C-100000@filabres.ualm.es>
Source record: 129523

I have an idea to any programmer out there.
I desperately need an utility to convert *color* WMF files from PC's (aargh) to GEM/3 and/or CVG 1.1 (both in color, of course).
Once converted, the file should be intact (i.e, no difference at all with the original WMF).

This program could be shareware. I'd register it as soon as it was developed. Anyone interested?

Of course, if such an application already exits, please tell me, also if this option is included into any other program not only dedicated to this task.

Thanx

# 1321. Problem registering Freedom 2

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: Ramiro Tellez Sanz <rtellez@filabres.ualm.es>
Message-ID: <Pine.A32.3.91.970121202006.35864A-100000@filabres.ualm.es>
Source record: 129524

Hi everybody!

I'm a registered user of Freedom 2. When I've tried to register
it, I've found some problems. These are: (I've ftp'ed the new registrable
version f2releas.lzh from ftp.cs.tu-berlin.de)

* When I execute the program FREEDREG.APP on my PMac 6100/MagiCMac 1.2.5,
all goes well until I have to choose the path to decompress Freedom.
Once selected the path (with Freedom 1.5e, also registered), MagiCMac
refuses to continue and displays the MAC dialog box to Quit MagiCMac
or Quit the Application.

* I've also tried to decompress the program on my 1040 STE (1Mb RAM).
Again, all goes well until I have to choose the path to decompress it.
Once chosen, I get two bombs!

Is FREEDREG.APP compiled for 68030 or above? Perhaps that's the problem.
My Falcon is at Titan, getting AB040 fitted, so I can't test all
this on it.

Has anyone suffered the problems as me? The docs are in German, so I
can't understand almost anything :(

Thanx in advance

Dungeon Master 2 is only available on PCs. Have a look at the Happy Puppy
page for some links to hints on it. I have almost finished it, but got bored
after spending about two or three hours trying to kill the last monster.

Try deleting some of the .INI files (or whatever they are called). Make a
backup of them first though. IIRC if you upgrade from an ST to a Falcon then
you need to do this to get it to realise that you have changed your
hardware.

So,

with the LAN port in use, what have you been able to accomplish, can one TT or STe or Falcon be set-up as a "Server" with a large hard drive and a laser printer attached and allow other Atari's to file share and print share to and from it???

Curt

Hi Robert,
There should be no problems running the Jazz drives on your Falcon. It
will be recognised by all the main HD drivers, though I would
recommend HD Driver V6 to get the best out of it. It may not support
all features (such as password protection) but should read and write
at full speed....
Hope this helps...
Dave B.
P.S. email info@toad.net, they should know and supply a drive for
you...

>68K based? Furthermore, does anyone know of some good Atari ST web
>sites?

Other than the amount of RAM, the 520ST and 1040ST are virtually identical. Adding either an "F" or an "M" (or both) to the model number indicates an internal "f"loppy drive, a "m"odulator, or both (thus, the 1040STfm has 1 meg RAM and an internal floppy drive, and a modulator for use with a TV set). There was also a limited run of 260STs sold in Europe, with 256k RAM. The 260, 520, and 1040 were delivered with TOS 0.98 on floppy for the very earliest 260s and 520s, and TOS 1.0 or 1.04 on ROM in later models.

The Mega ST is a two-piece unit with an internal DMA port, an internal expansion bus called the "Mega bus", a blitter chip (dedicated pixel block movement processor), and a really nice detached keyboard. It was made in 1, 2, and 4 meg RAM models. Upgrading the RAM on the 2 meg model is tedious but trivial, if you can get the chips. The Mega almost always had TOS 1.02 on ROM.

The STe is almost identical to the STfm in appearance, but uses SIMMs for RAM, and has DMA setero sound and an enhanced color palette (4096 colors vs. the old 512 colors). It was delivered with TOS 1.60 and 1.62, and 2.05 or 2.06 can be easily installed in most STes (although not all have large enough sockets and will require new ROM sockets for a ROM upgrade). TOS versions from 1.6 on support only 512k, 1 meg, 2 meg, and 4 meg configurations (in the ST and STe). The 2.5 meg configuration was dropped, although some pathces exist that are supposed to fix this.

The Mega STe had a "wedding cake" style case with internal floppy and a bay for an internal hard drive, and a VME expansion port, plus 2 additional

(faster) serial ports and an Appletalk-compatible LAN port in addition to all of the STe enhancements. Some models were delivered with 720k floppies, but many had 1.44mb high density drives. The CPU has 3 speeds: 8 MHz/no chace, 16MHz/no cache, and 16MHz/cache, which makes it from 1.5 to 2 times as fast as a stock STe (depending on the operation being performed), plus a blitter. It also had the external keyboard, which moved the mouse and joystick ports to the ends of the keyboard case (they were underneath the Mega keyboard). Most MSTe models were delivered with either TOS 2.05 or 2.06 (there are rumours of other versions but I haven't been able to confirm any of them).

The TT030 is a 32MHz 68030-based system in the same style case as the MSTe, but in white rather than light grey. Sound is the same as the STe line, with the addition of an internal speaker (or "squeaker"). There are a total of 4 serial ports plus the LAN port, the usual ST ports (less the monitor port - more on that in a moment), and an external 25-pin SCSI port (plus the internal one). The TT requires a VGA monitor, or a very-high-rez monochrome monitor with a 15-pin high-density sub-D connector. On a VGA monitor, it can produce all 3 ST resolutions, plus TT low (320x480x256) and TT medium (640x480x16, or "standard VGA"). This is the fastest computer Atari ever produced, and several were purchased by NASA for use in designing the Space Shuttle and used in Denver, CO until recently (how many of you guys knew that?).

The Falcon030 is in a case similar to the 1040STe, and has (usually) an internal IDE hard drive of 65 or 85 megs, a DSP for audio (or any other purposes to which a programmer may wish to put it - processing JPEGs is one application of which I know), a 16MHz 68030 CPU, and 1, 4, or 14 megs of RAM (using Atari RAM boards you can't upgrade it yourself, but several third-party boards are available which use SIMMs). The actual RAM installed for a 14 msg Falcon is 16 megs, but the top 2 megs are reserved for system i/o and such. The Falcon also has a "processor direct" slot which is used by some PC emulator cards, and all of the usual STe ports except the DMA port - a SCSI-2 port was substituted there, putting the SLM-series laser printers out of work. The serial port is interesting in that, depending on how it is addressed, it can be limited to 19200 bps like the ST port, or go to 230k bps (although it's next to impossible to find a modem that can handle that speed). The Falcon also has the LAN port introduced on the MSTe and TT.

Hallvard's FAQ pages (referenced on my Web site) have vast amounts of information, but that's a quick overview.

Yes, do tell, Mario. Inquiring minds want to know!

I have successfully used MIDIcom for all of that (but dear God, is a screen
dump slow over MIDI). I still use it for moving files from one machine to
the other - it's much easier than sneakernet.

Hi, everything you said is true, except that you can not place/add the
nemesis with the Centurbo I.
The centurbo I is ready, since a long time actually. The latest
revision of this card is very very very stable.. And with the worse
case you still can switch with a toggle button to the original falcon
16 mhz.
The price is not even 300dollars. It is 150-160 dollars. :)
However Centek ( the company who also does the Phenix) is supposed to
finnish their new card. the centurbo II, price higher, but it really
rocks.. ( price around 400 dollars).
The centurbo should be ready soon now.
The specif are really good , and off course very stable.
This card, will incorporate their new OS, "dolmen", full 32 bit bus,
great acceleration etc.. More detail in the near future..
The problem is that they didn't want to ship outside france.
But I've talk to a person about it, and they are trying to find a way
to ship in the us, if the demand is interesting enough.
"they are working on it" not definitive. So don't blame me, if they
will not ship into the us..
Anyway, still the Phenix will be ready in march for developpers and in
jun/jul for public.
Bye. :)

That's a poor choice of words. This text I am typing now 'accesses'
the OS and by no means needs supervisor mode or to be running in
the kernel.

Those things which need to be there are by no means 'many'.

>What parts of QT do you think are actually used?

That which is commonly used would be covered by MPEG.
Even the rest which are often touted and less often seen
would be covered by other formats (like vrml).

Rewrite() creates the file if it does not exist and truncates it if it
already exists. In either case the file pointer is positioned at the
beginning.

From my Prospero Pascal days I have a vague recollection of wierd
behaviour if I mucked up or omitted the Assign() function. Might be
worth checking.

>(Which does run on Falcon, and has supposedly lots of improvements
>compared to the earlier versions. It even has some features from MAC
>Logic 2.6!)

Can anyone advise price and availability of the Logic 2.5 Atari upgrade. I saw it mentioned on the EMAGIC web page at the end of 1996. It was stated that it was available from the distributor in the country in which one resides. My local distributor of EMAGIC products didn't know about it and didn't really want to know as it was for Atari. I then phoned Sound Technology in the UK and they also didn't know about it. I followed up with an email to EMAGIC telling them of my enquiries here and in the UK and asking for a price to buy direct from them. I received a reply telling me to contact my local distributor !!! What gives ???????

Your continued spamming of c.s.a.s is becoming annoying. You, Sinclair-Day,
"Jedi," Quinlan, et. al. - KNOCK IT OFF.

This bullshit has gone on long enough. Either take it to email, take it
SOLELY to the advocacy groups, or drop it.

Brian, the /algorithm/ isn't the bottleneck, as you well know. You could
have a zero-time algorithm, and VM would STILL be slower than "real" RAM
becasue VM uses that hard drive for the virtual memory space. It doesn't
make a damn bit of differecne if the VM algorithm takes 1 microsecond or 50
microseconds - you can't get the data to or from the hard drive in less than
about 8ms (on average for fast drives - slower for less-expensive drives).

Yet another specious argument blown out of the water...

Which leaves Win95 totlly out of the picture. <G> Bill G. forgot to mention
that it stands for 1895, not 1995.

>
>[deletia]
>>Does it have VM? No? Well, that's an obvious start. Does it have much
>>in the way of network support? No? Does it have memory protection? No?

Memory protection isn't needed in single-tasking mode, and to the best of my
knowledge, all of the multi-tasking OSes available for TOS-based computers
have MP options (which can be disabled if one has a burning desire to run an
MT on a plain-jane 68000).

As for network support - well, I have two TT030's networked with the
on-board hardware and free software at home. Granted, it's limited to only
256 nodes on the network - a really severe limitation for most home users,
I'm sure.

And if you want to talk about things that are missing - where's the MIDI
support in Mac OS? Where are the MIDI ports? They aren't on the
motherboard, are they?

You guys are ridiculous. Every person has his own favorite computer and/or
OS. An /intelligent/ being uses the system that does the job he has in mind
for the least money, in the least time, with the least hassle (or however he
decides to trade off thsoe three mutually-incompatible goals). EVERY
desktop computer has flaws and strengths, and there is nothing one can do
(in terms of applications) on one platform that can't be done on another.
Trying to "convert" Atari users to the Mac, or PC users to the Timex
Sinclair, or any other conversion, is not only a waste of effort, it's a
waste of bandwidth.

The continuous insistence on cross-posting this idiotic thread into a
non-advocacy newsgroup is not only obnoxious, it's a form of spamming. You
will note that I have redirected all but one of my follow-ups (momentary
lapse there).

If it's a bus mouse (not a serial or PS/2 mouse), yes. However, it will be easier (in most cases) to find a mosue that's made for the Atari, or is Amiga/Atari switchable (the Beetle Mouse has such a model, for example). The best mouse I have ever owned is sold in North America by Best Electroncis as "The Best Mouse" - mine is at least 6 years old and still going strong. It's sold in Europe as the Schnieder Bus Mouse and has a 9-pin sub-D plug - just goes right into the Atari mosue port, no special drivers, no wiring.

Next best for simplicity is to use MOUSE2.PRG and plug in a serial mouse on your Modem1 port; this is not a real good choice if you don't have multiple ports, however.

## 1349. Emulating the ST on a PC?

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: rick-ellis@vnet.ibm.com
Message-ID: <5c2g0i$m28@zen.hursley.ibm.com>
Source record: 129552

I've sadly moved on from the good old Atari ST to a PC but hark for the days playing some "decent"
games..
Are there any software only emulators for the PC that will run Atari ST stuff?
I've seen the 'hardware and software' emulators and am bemused why I shoud pay up to 100UKP for a bit of hardware when I have my trusty ST in the cupboard. In fact why should anyone buy
a hardware emulator when you can pick up a second hand ST for less than 50UKP?
The only reason I want to emulate the ST on my PC is to avoid running two systems.
I love the nostalgia of those old games but at the moment have to settle for Sinclair Spectum
games on a perfectly decent software only Spectrum emulator (Z80).
Somebody please tell me that there is such a software only emulator or that someone will create
a software only emulator.
I wouldn't mind if it crashed once in a while...after all my ST did that anyway!
Thanks to all.
Rick.

## 1350. FS: Tons of stuff, all kinds

Newsgroup: comp.sys.atari.st

A warehouse store here just obtained a large number of Atari systems, perhaps one hundred carts (from Asteroids to Star Raiders and Ballblazer and beyond), countless power supplies, drives (perhaps twenty-five Rana drives, and many Atari models), what looked to be a tape backup for Atari, and various cables, software, memory cards (some without plastic jackets; raw boards), OS cards, a few CPU cards (6502B), 4-way serial splitter boxes, and a few modems and modem software.

I am not an Atari wizard myself, and so I can only mention the names: everything from the 5200 and 7800s up through the 400 and 800, XE130s (several), 600s, 1200s, and various other STs. There was one original Atari Home Video System for the truly avid collector in you.

If you are interested in this material, fax him - he'll be too busy to answer the phone for a little while -- at 408-462-6798 and describe what you are looking for. The systems are still spread out over two sites and he may have to go looking to meet your needs. The store is "Computer Jones" and his name is Brian Thomas.

## 1351. A3 Printer with Cubase Score

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: kaitxo@cix.compulink.co.uk
Message-ID: <E4DpvK.HIx@cix.compulink.co.uk>
Source record: 129554

Has anyone any experience of using an A3 printer with Cubase Score (on an Atari, of course!) I'd particuarly like to use a bubblejet, and am thinking of buying a Cannon BJ330, but after problems that friends have had with dot matrix A3 printers and Cubase, I'm a bit wary. I did ask the Steinberg helpline who said I should ask Cannon. Now there's optimism (and complete ignorance of how the Atari works!)!

Hi Al,

The CACHE.CAB file is rewritten after every download. Obviously the larger your cache gets the bigger this file gets:( It's a real pain. Why it can't just be appended I don't know.

Hi there,

The 040 board in the UK costs just under ï¿½500 UKP ... try Computers Direct across the atlantic as they have been supply some boards to USA/Canada.

It apparently works "OK" with CAF but does have some teething problems on some of the modules but there are work arounds (but I'm not into music too much so I didn't pay too much attention).

Maybe Magnus Kollberg is around and can answer these questions ???

All in all it is costly but with a little Fast RAM and the new 040 drivers set from Doug Litle @ Black Scorpion software the compaitibilty is very high with some excellent performance figures ... which is why I have one on order !

I&#65533;ve lost too!
The Gemulator96Demo works wery well! With a Swedish TOS2.06, The Tos-image (dump) renamed to "magic_pc.os". Or you can also try "magic.ram". TOS.IMG does not work for a tos-dump if you not patch it for use on a bootdisk. If you search the Gemulator-file with an HexEditor you will find the filenames (Search for "magic").

I did the same in Gemulator Classic, but did&#65533;nt found nothing to help.

Hi marcf@cableinet.co.uk, on 21 Jan 97 you wrote:

m> (1) Is that a SCSI port on the back of the thing? Can I use my old
m> SCSI external drive from my Mac?

No. It's the DMA port. It support something very close to SCSI but not close enough! You need to get a host-adapter which will make it SCSI compatible. These range from boards (adSCSI etc) to special cables containing the adapter in-line (Link 1/2). There is no reason why the Mac drive should not work. I am using a drive from a Mac via an adSCSI board on my STM.

You will also need a s/w driver/formatter etc. I use CBHD (which is free), you can find ICD and Supra stuff on bulletin boards or by ftp. The favourite commercial driver ATM seems to be HDDriver.

m> (2) Would I be able to use a Zip Drive instead?

Yes.

m> (2.1) If so, is an Iomega Driver available? I've not seen one on my
m> travels.

I think they are still about.

m> Also, I've got a 3.5" DD that is formatted to just over 800K - yet
m> when I format using the OS, I only get about 706K of space. I need to
m> back up the 800+K disk (which has 805K of (crucial)) files on it!
m> Shit! Any method of formatting to 810K or something?

Yes. The are floppy formatters which allow you to increase the number of tracks and sectors/track. Discs formatted in this way are not always reliable. Why not just split your archive over 2 floppies?

w> applications. eg. STiK needs a cookie jar extender. Does anyone know
w> the best way to run superboot with MagiC ?

Make sure Superboot comes just before MagiC in the AUTO folder. Once you have MagiC running you won't need the cookie jar thingy as MagiC sets up a cookie jar.

w> I'm beginning to think I have wasted 70 quid. Please could someone
w> reassure me I haven't.

I adopted MagiC v2 on my STM about a year ago and haven't looked back! Persevere! It gives a whole new boost to yoour computing. There are some old programs which are not happy with MagiC as they were designed before mutlitasking on the ST was even thought of. You can either go back to TOS for these or (better) find a modern replacement for them.

You might want to reread your own statement because it doesn't make sense.

>>There are many things which cannot be grafted at the application level.

Anything that needs to access the operating system in protected mode.

> It's a poor start. VM is not at all necessary. In microcomputers,
> it only serves to allow developers to be immensely sloppy.

> Memory Management would be a much better 'modern' requirement.

Interesting. Are you claiming that no programs for microcomputers require
large virtual address spaces? That is perhaps true but it is far better
to have a large virtual address space then to constantly read data from
a disk. Virtual memory paging algorithms are faster than disk caching
algorithms.

> For those parts of QT that actually get used: yes.
> Although, this is applications level as well.

What parts of QT do you think are actually used?

# 1362. How to set PageStream screen colors?!

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <BJO22gt.johnhechtman@delphi.com>
Source record: 129593

I'm having a problem getting PageStream to display in color. I've got an NEC 3D monitor and a 14 meg Falcon. Problem is that the color pallette shows a particular color (say red, for example), I see the actual color in the display box, but the screen color is a shade of grey or black.
.
I've tried editing the colors, but I don't understand how to set them with the color boxes and sliders. If I don't know which box of the 16 color/boxes is supposed to be, for example green, how do I know which box to set for which color?
.
The NEC 3D is a multi-sync monitor and so easily able to display a much higher color pallette than what PageStream is working with, right? So how do I set PS to take advantage of it?

Thanks in advance for any/all help!

John

Same problem here. It seems that when it was upped to Emulator Inc's website someone forgot to include some needed documentation and/or a gemulator.ini file the program keeps looking for. The website also says that Gemulator 3.6 will not allow access to your hard drives... why then does Gemulator 3.6 tell you that it's remapping all your drives to the ST? (Drive C: -> C:, Drive D: -> D:, etc).

Darek: If you are reading this could you possibly fix this so all those w/out your Gemulator card can give it a go? The ZIP on your web site *ONLY* contains GEMUL8R.EXE and -NOTHING- else! No docs or ini file!!!

Thanks!

## 1365. Atari picture files to PC?

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: ad634@torfree.net
Message-ID: <E4CE7v.8y3.0.queen@torfree.net>
Source record: 129596

Anyone know how I might take my NEO and SPC picture files into a Win95 or WinNT graphics application?

Thanks.

> If, on the other hand, it is likely to go down in a ball of flames:
> then it's a problem.

Your postings get more bizarre each time.

Running out of memory has nothing to do with the OS in question. It's a
matter of using the memory for programs. If you crank up enough of them
you will run out. If you run a single program that needs more than you
have free, you will run out.

>>I would be very surprised, based on your postings, if you had much of a
>>grasp of computer architecture. If you do, you sure aren't using it.
>
> I have enough to know that SCSI fast wide (or even RAID) doesn't quite
> compare to multiple IO channels or solid state disk.

Um, you just demonstrated that you can masterfully make a dumb
comparison. Big machines might have multiple I/O channels for a RAID --
what do you think each of those channels is? Very often, fast/wide SCSI.
You can buy dual-channel UltraSCSI cards for Macs; they're intended mainly
for RAIDs. (Single-channel RAIDs are possible, but not as fast.)

> Furthermore, such knowledge really isn't required. All that I have

> needed.

First you say you have knowledge of computer architecture, as a way of
trying to bolster your argument, now you say you don't need it. Make up
your mind.

>[deletia]

> try to put on things.

Strange that people don't use hard drives instead of DRAM, then.

OK, that's a cheap shot. I'll give you the benefit of the doubt and assume that you really meant to type it reversed. Simple mistake, everybody does it.

However, you should really look at VM in this light: VM is like having a large but very slow memory cached by the computer's DRAM. The computer's DRAM is in turn cached by an external "L2" cache, which is in turn cached by a internal CPU cache. Ultimately, the CPU keeps data it is currently operating on in extremely fast registers. Each level in this memory hierarchy is much slower than the one which preceded it. The idea is to avoid too many misses so that fetching from the next slowest member doesn't happen often.

The reward is that if the miss rate is kept down, you can make a slower but cheap memory perform almost as well as a faster but more expensive memory. The techniques for reducing miss rates are well known and are the subject of intense research by computer architects. Although the techniques used for caches are somewhat different from those used for VM, there is a striking amount of similarity.

Furthermore, both systems have breakdowns. Just as VM can sit there and grind the disk continuously, L2 cache can exhibit thrashing behavior which makes the system perform worse than it would without any L2 cache.

In both cases, though, the benefits are too good to ignore.

>>And what the hell is that non sequitur supposed to mean?
>
> It means that some of us have been doing this for awhile and
> have actual empirical knowledge of the subject that trumps
> quite a bit of what academia may be feeding you. It's a shame

Ah, an anti-academic. If you can't win an argument, try to paint the opponent as living in an ivory tower.

>>Oh, wait, I get it. You're trying to make an obscure and clever reference
>
> Amongst memory consumers, the reference is by no means obscure.

I am a memory consumer who was hurt by the incident, yet it took me a while to remember.

>>to the scare that artificially inflated memory prices a while back.
>>Unfortunately, as a response to the point I was making, it falls flat on
>>its face.
>
> Money is never irrelevant.

So you're trying to say that because RAM was excessively expensive for a while, virtual memory is bad? Sorry, either you're gibbering, or you're trying to sidetrack from the issue of whether VM is a Good Thing.

> Perhaps this is the reason Mac is in its
> current state. When I got my first ST, you could buy a new car for
> less than some Macs. They're trapped in an academic mentality and
> aren't capable of real engineering.

The fact that Apple had models in the 80's which initially retailed for more than $5000 (some were closer to $10000) does not mean that they had an "academic mentality". It means only that they were targeting a much different market than Atari. IMO, it was a mistake for Atari to ignore that market, since targeting it would have given the ST much more credibility as a serious computer, as well as ensuring that Atari kept up with current technology instead of falling far behind like it did.

It was also a mistake for Apple to ignore the low-cost market until recent years. There is no rule that says you cannot design a machine which is easily scaled to several levels of price/performance.

> We are just fortunate that RAM doesn't impose the same kind of
> constraints that it once did. To believe that it never will again
> to the same extent is grossly naive.

In the long run, RAM will get cheaper and denser. This is a very non-naive idea based on knowledge of what goes on in semiconductor manufacturing. The price scare of a few years ago and the current low prices are symptoms of a commodity market. But nothing will change the fact that roughly every 1.7 years (if I remember correctly), DRAM density quadruples. This is a rule which has held true for 20 years or more. It's why I paid $50 or so for 256K of RAM to upgrade my 800XL in the 80's and paid $90 for 16 MB of RAM a few months ago.

>>There are many things which cannot be grafted at the application level.
>
> Like What?

Like anything which needs to be global and standardized. You could try to graft something like UNIX pipes onto programs at the application level, but it wouldn't be nearly as good as if it were done in the OS itself.

>[deletia]
>>Does it have VM? No? Well, that's an obvious start. Does it have much
>
> It's a poor start. VM is not at all necessary. In microcomputers,
> it only serves to allow developers to be immensely sloppy.

How is it sloppy to be unable to anticipate that J. Random User will try to run fifteen programs simultaneously on his 4 MB Mac LC? Each of those programs could be as tightly coded as possible and J.R.U. would still run out of RAM.

I really think you're pulling this out of your hat. Most developers have to try to code for the lowest common denominator. That automatically includes trying to avoid dependence on large amounts of memory being present. As the average user gets more and more memory, developers set the bar higher and higher, but in no case do they just sit around saying "hehe, let's make our software a pig, we don't care, we don't have to".

Some developers are clearly much worse at efficiency than others. For example, Microsoft Word 6 for the Mac is an insufferable pig, both for the CPU cycles it burns and the memory it eats. The user reaction was to dump it, something which was probably a factor in Microsoft's recent announcement of its creation of a new Mac product division which will develop Mac products from the ground up. (As opposed to the current policy of doing poor ports from the Windows versions.)

> Memory Management would be a much better 'modern' requirement.

Define "Memory Management".

>>in the way of network support? No? Does it have memory protection? No?
>
> Actually, MagiC does. Network support can exist on the application
> level and has been existent on the ST's for quite some time.

Network support needs to be an OS service. It is too much to ask every application developer to reinvent the wheel.

MiNT/MultiTOS probably have at least a TCP/IP protocol stack, but there seem to be very few people that use those particular offshoots of TOS.

It is always very funny to see the extremist Atari advocates gloat about the LocalTalk compatible port on the Falcon. They never mention the fact that Atari didn't have an AppleTalk network driver (and, to the best of my knowledge, nobody outside of Atari has ever written one either). A network port without the software to support it is worthless.

>>Sounds like a limitation to me. (Maybe things have changed, but in my
>>Atarian days there was little to no support for any of these things, and I
>>haven't seen evidence of them in my fiddling with MagiCMac.)
>
> I'll consider this methodology the next time I fire up the PC
> Mac emulator: Executor. '-p

You were talking about MagiC. I assumed that MagiCMac is the same OS, just running on a Mac instead of an Atari. Did I assume wrong? I thought that was the idea behind MagiCMac.

>>Does TOS have a 3D graphics API? Does it support hardware acceleration
>>for it? MAJOR limitation. This is hardware of today we're talking about.
>
> API's are all applications level.

You have an odd definition of "application level". Usually it refers to code that sits in an application instead of in an OS. An API is the interface offered to an application for an OS service.

> Although 3D hardware acceleration would be a nice addition.
> However, this could also be added to TOS with no problems.

That doesn't change the fact that it's not there.

>>Does TOS have anything like QuickTime?
>
> For those parts of QT that actually get used: yes.

What parts do you think don't get used?

> Although, this is applications level as well.

Is it? Is it practical to expect every developer who wants to include digital motion video in their program to reinvent all of the technology that's present in QuickTime? QT means that programmers can easily implement fairly advanced features in their programs with minimal effort. It means that you don't have to worry about interoperability with other digital video programs, because if you use QuickTime you automatically get it. Just as an example, you can cut, copy and paste chunks of video using standard Mac clipboard operations between any two apps which support QuickTime.

This would be extremely impractical to do at the application level.

Anybody get this emulator working? I tried TOS 2.06, the disk based version
of 1.0, and the Magic that comes with the Magic PC demo. Gemulator Classic
seems hell bent on using a Gemulator card, even though the docs say that
you don't need one.

Hello Simon

: cartridge port for the dongle. Certainly cubase had this problem and a
: special dongle for the TT was required.

Cubase v2 dongles don't work on tt or falcon. However v3 dongles do,
leading me to think that notator might be ok on the tt with a standard
dongle. I wouldn't buy the product on the strength of that, mind you ;-)

Best wishes

# 1374. Music DTP error or GDOS error??

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: Richard Krejstrup <di94rkr@student.hk-r.se>
Message-ID: <32E4DC87.4F6E@student.hk-r.se>
Source record: 129605

Anyone here who knows anything about a program called
Take Control Music DTP ?? It was developed at a University
somewhere in the yearly 90ies (released in 92 ver 2.2d).
It's the best music dtp style program for the atari I've
seen, but the gdos printer routines doesn't work that well...
I have had to get a IMG.SYS and make an outprint to disk
in a .img format and then print it. I've tried with lots
of different laser printer drivers (I got an HP laserjerII)
but it bombs out just when it supposed to sent the stuff
to the printer (it loads the printer fonts allright).

Do you know if there is a newer versin of this program
available (I don't think so, but I don't _know_)?
Any sugestions of what could be wrong here??

I run it on an Atari Mega STe 4/210 with NVDI3. Outputs
doesn't work at all with NVDI and with GDOS1.1 I can get
a *.img file as mentioned above...

Anyone? :|

>Pagestream sticks in there I guess.

The distiller has to encode the PostScript fonts used into the PDF file,
I believe, in case the viewer doesn't have that font installed. Maybe
it can't find one of the fonts you have used? PageStream has to be
tricked into putting the PostScript font in the PS output, either by
using a non-PS font (so it converts it), or by some other technique which
I can't remember, but I've done it. Try generating a simple PostScript
file from PageStream just using non-PS fonts, eg the CS Garamond font.
Then see what Distiller does with that.

This could be totally un-related, but SunOS 4.1 has problems accessing
webcrawler.com as it has too many DNS numbers for this version of SunOS
to cope with. Maybe this is related? Try giving it the numeric address,
as this solves the problem with SunOS. (152.163.202.22 is webcrawler.com)

>It was mentioned in Atari Computing magazine issue 2 in the Papyrus article
>that Protext is still being developed.
>
>A club member would like to know where this softare can currently be
>obtained, and who is continuing development.

I started searching for this in mid 1996 and on a trip to the UK obtained an address to which I wrote whilst still in the UK. I received a lengthy reply some time later(many weeks in fact) that was very encouraging. The prg was being re-issued for Atari (v6.7). I was sent a spec sheet for the PC version which indicated support for Vector fonts.Users will know that Protext on Atari did not support Vector or bitmap fonts.I got quite excited as I still feel Protext is the best all round WP prg for the Atari.
I wrote(via email) back asking about the Vector fonts support and whether the prg was fully compatable with the Falcon. I didn't get a reply at first and sent a reminder which did bring a response but no further information. I can advise the contact details I have and perhaps someone in the UK can follow up (maybe the guys from ACG.....what a good mag by the way !)

My contact has been with Brian Watson of Protext Software,Harrowden,39 High St,Sutton,ELY,Cambridgeshire,CB6 2RA.
Tel (01353) 777006 7.00pm to 9.00pm weekdays Fax (01353) 777741
email address: brian@spheroid.demon.co.uk

He gave me the following address where orders could be placed:
COMSOFT,10 McIntosh Court,Wellpark,GLASGOW,G31 2HW
Tel/Fax (0141) 554 4735

Should anyone get hold of some updated info re the release date and features and compatibilties it would be a good idea to post the information here. I have offered to do this but got no response. One last thought is that the price I was quoted is 40.00 UK pounds and that there were no discounts for upgrading from earlier versions

# 1381. Atari 1040ST mouse

Newsgroup: comp.sys.atari.st
Date: 1997-01-21 00:00:00 UTC
From: gfacini@gov.nb.ca
Message-ID: <5c2s9a$86s@agate.nbnet.nb.ca>
Source record: 129612

My Atari Mouse is getting old and is not working properly.
Does anyone know if it is possible to hook up a microsoft
compatible mouse to the atari. If so, how?

Thanks,

Gino Facini (gfacini@gov.nb.ca)

# 1382. fdi / dat backup progam

Hi Atari friends,

I've bought a FDI for my Falcon now at last, but there was no backup program
for a DAT in the package.
Could someone please help me out?

Thanks very much!

Chris

Thoguht it might be, but there are others reading this who might not have
done.

>... maybe Demon's
>newly configured News server is to blame (and would that be a surprise?)

Judging from the number of psams I see that were injected through Demon's
open port, and the continuous problems I read about from "happy" Demon
users, I'd have to judge that Demon is to the UK what AOL is to the USA, in
terms of quality of service, at least. %^<

Looks like he fixed it - but the .sig file is added below the cut line, so the correct email address is now cut off when a "proper" newsreader quotes the body in a reply.

I understand what Paul is trying to do, and I approve - but the method he's used will prevent many legitimate replies as well as blocking spam.

Yes, but... If it won't run from the hard drive on the ST, no promises on
emulators.

TOS2WIN is a good emulator from a Euro developer - I use the demo version to
check out software for compatability here (I don't actually /do/ anything
with it, but I do plan to buy the full version as soon as the budget
permits).

You can check out the demo version from
http://www.aixit.com/tos2win/info.htm

Aixit has a number of other interesting products (easier to find if you read
German, though).

No - Notator is tied very close to the ST hardware. It _will_ work on an
ST, STE and Mega ST, and also the Mega STE (with the cache settinsg as in
the NSL manual) but it definitely _won't_ work on a Falcon, and probably
not on a TT either.

Thank you for your reply...
Actually I already have been able to solve the problem.
It was just the position of CAB Overlay. Geneva seems not to like a
Cab-for-Mintnet in the modules folder. I had just to move it into the
Cab.app folder. Now works fine...

ciao,

Lodovico

>WinNT graphics application?

The Spectrum pccies may be a problem (though I think there's a SPC2GIF
convertor someplace), but NEO is easy. It's a 32k bitmap with some header
info determining the color palette to be used. You could use one of the
many NEO2GIF conversion programs on the ST, or run NeoChrome under TOS2WIN95
and use the PrintScreen function of Win95 to copy the Neo pic to the
clipboard, and then to the MSpaint app.

Sounds as if it doesn't wait long enough for the printer to acknowledge
receipt of data (or some similar timing problem). I would try a printer
spooler/speeder (Mspool, Outburst are a couple that come to mind) and see if
that fixes the problem.

>Sorry the ST only has 4 sound channels

That part is correct.

>you need at least 16 to play MIDI,

That part is wrong. I think you're confusing the number of MIDI channels with the number of audio channels; there need not be any relationship there at all, although most musicians using MIDI instruments assign one voice per channel.

Midi Music Maker will play a bunch of different music formats, including MIDI (both format0 and format1) on an ST without a synth. Granted it sounds better with a synth; it plays quite well, though, and that's what Matt was looking for.

Okay, so I was browsing around in alt.steinberg.cubase again, and there are some nice ST boys over there who could use a local merchant or two... I mean in the same country as Japan or nearby.

Anyway, here's the quoted text. The questions are probably being answered now, but I guess I just wanted to ask if anyone knew of any Eastern suppliers or import companies, to tell Mr. Kitano of them and ask him to spread the news. I don't think he gets around c.s.a.st much.

Sorry about the multiple threads, but they were different topics.

[SNIP!]

digital I/O, I know these sound cards are expensive. So if Falcon has digital I/O and cost is less than these PC sound cards it's would be cool for me.... But here is some problems.

#1: Atari is not populer in Japan
Almost 99% guys who making music on computer are using Macs.
So as music computer, PCs are rare too. But populer as buisiness and game machine in Japan. you know I'm not typical Japanese type of guy, I think. : )

#2: I can't buy any Ataris around Tokyo Japan these days
I wanna buy Atari. What can I do?

#3: Because of #2, there is no software/hardware for Ataris.

Could you understand how many problems I got?
Any suggestion?

And other things what I wanna know is....

-price of Ataris (Falcon,ST,STE or whatever. And if you know please tell me secondhands prices too.)

-DMaker's ability and function. tell me your impression.
(Have you tried this one? you can download it from
Steinberg's FTP for free) I don't need Atari to use Cubase
currently. I need Atari for DMaker.

-Compatibility of files.
Can I convert files Atari to PC easily?

thanks
keep in touch
bye

That's due to ignorance - I've never had a plain STe.

>Also STe's, Mega STe's, and Falcons (and maybe TTs) have Jaguar compatible
>Joystick ports.

Well, the TT and the Mega STe do NOT have the Jaguar (or "enhanced")
joystick ports, but the STe and the Falcon do. There's so little support
for those ports, however, that I usually forget they exist.

Uniterm is the best I have found for full VT100 emulation. Other programs
that claim VT100 emulation leave out features such as separate scrolling
regions, which is annoying if you use mainframe editors.

# 1401. TT Ram Board Jumpers?

Newsgroup: comp.sys.atari.st
Date: 1997-01-22 00:00:00 UTC
From: fl@zot.io.org
Message-ID: <5c6ipd$9cn@zot.io.org>
Source record: 129432

I have a TT 030 with a revision H mother board and an Atari Rev. C TT ram board installed. Currently it houses four 1 Meg, eight chip SIMMs.

I am thinking of upgrading to four 4 Meg simms. I understand that I should look out for the newer three chip simms and go with the older eight or nine chip models.

My question is about the six little jumpers on the Ram board in my TT. Currently they are set up as follows (please excuse my lapse into Ascii art - best viewed with a monospaced font):
.
In this picture ! represents a jumper connecting two pins.

```
------------Simm------------ ^
. Towards the
! Back of the
------------Simm------------ . Computer

......
------------Simm------------ !!!!!.
.....!

------------Simm------------
```

What should the proper jumper configuration be so that it will run with 16 Megs?

Thanks very much.

I don't have a spare but you mean to tell us System Solutions doesn't have one, or can't put you in touch with someone or some shop that has one? Is there a local user group you could contact?

I found that with HD Driver or HUSHI installed RATEHD will skip
some or all of the drives I have connected at times. Not always,
but most of the time. This was on a MegaST and Falcon.

Loads of Atari ST gear for sale:

1040 STe good working order
Atari (original) Hires Monitor (tilt & swivel) - may still work. I think
the power suppply needs looking at. May just be an internal fuse blown.
External DS Floppy drive
Spare Power supply
Spare Atari 1040 ST. (blown ROMS, I think)
2 or 3 mice, joysticks, dust cover
MIDI cables, audio cables, manuals
2 Large disk boxes (100), 2 small disk boxes (50), other smaller disk
cases
Books, professional software (C programming, DTP, Music, Graphics)
About 500 disks *PACKED* with software (100's of games, magazine cover
disks, public domain material, downloaded software)...
Magazines, other material...

Disks from STAMPEDE (complete), ST USER, ST FORMAT, ST REVIEW most issues.

Sell the lot for £100. Will consider offers. May split.

Reply to my email address.

Please ask for any specific software you require. I may have it.??..!!??

Source record: 129437

Hello,

I recently found a Thomson 5210 ( I think the number is correct) monitor someone threw out, and I want to know
if you can hook this up to a 1040ST (No FM). I am currently using it as CGA monitor with an XT, but I noticed
there is a switch with 4 settings on the front(It says RGB monitor on the back.) Does anyone have the specs on
this beast? I would love to know if I can use it like an SC1224...

Thanks

Curtis Blanton

You should need absolutely nothing atall, I believe that all programs
capable of formatting to 1.44 MB on the Atari will format it so that
it is PC compatible, it should work. If not then format the disks on
the PC first and use the atari to put the stuff on them.

HD Driver v6 definately supports password and write protect on Jaz drives.

There is a CPX that handles this included with the HD Driver package
we sell, it also works with Zip drives.

All the best,

# 1411. MagiC Mac, Modem 1 and STik 1.12

Newsgroup: comp.sys.atari.st
Date: 1997-01-22 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <32E5BC46.583E@owens.ridgecrest.ca.us>
Source record: 129474

I've been trying to set up STik on my
Quadra 900, but am having about as much
trouble as I did with NetScrape on it.
As it turns out the Quadra 900 dosen't
do hardware flow control, nor can I get
it to do software flow control. Once
configuring the Mac dialer (Free PPP)
for no flow control the dialer works
fine, and as you can image, works
with NetScrape with many error due
to no handshake. There is suppose to
be a hardware mod to fix this, but my
soldering iron won't get hot over a Mac:).

Anyway when trying STik 1.12 under
MagiC Mac I get an exception error
#2/$00FFFA01 and an increase in the
I/O counter on the Mac utilites menu.
Dosen't matter if I run it as an acc
or prg, multitasking or singletasking.
At one point I got the STik dialer up
to the phone number before the error.
It looks like it's having a problem
with the modem 1 port that is set
up under MagiC Mac.

I was able to log onto my I/P with
Connect, 57600,Xon/Xoff, modem 1 with
out problems under MagiC Mac, same
settings as above. After looking at the
setter program for the Modem 1 app,
I seen mention of the Quadra 900 and
something about SCC. I think that the
problem is either here with the Modem 1
settings, or STik is expecting something
that isn't there.

Anybody make any sence out of this?

Thanks,

Mike

## 1412. (Gem) Games for MagiC (Mac)

Newsgroup: comp.sys.atari.st

```
> >Dungeon Master 2 is only available on PCs.
>
> Is this different from Dungeon Master 2: Chaos Strikes Back? I have that
-
> for my ST.
```

DM2 (Chaos Strikes Back) for the ST was originally designed to be the
'Module' for DM. The people at FTL took too long to write it that they just
added the DM engine to the module and made it a 'new' game. Dungeon Master
II for the PC is the 'real' sequal for Dungeon Master. And it is awesome!

> a software only emulator.
> I wouldn't mind if it crashed once in a while...after all my ST did that
anyway!
> Thanks to all.
> Rick.

There are two options that I can think of off the top of my head:

1) This assumes you have an MS-DOS machine setup!
- Get Gemulator Classic v3.6 from Emulators, Inc (MS-DOS Only!)
- Get Gemulator96 from Emulators, Inc (Runs in Win95!)
- Install Gemulator which will emulate your HDD as an ST drive
and uses your PC's floppy drive (no disk images).

2) This assumes you have a UNIX setup! (ie: Linux)
- Get STonX off the Web
- Compile it for your system (a two-step operation)
- Run a full screen, fast Atari ST emulator that emulates
the ST at a hardware level via software only!
- Converts your UNIX filesystem into AtariST on-the-fly, can
load 'standard' Atari ST disks from the floppy drive or can
use disk images for non-standard disks.

I have both emulators, Gemulator96 (Demo) and STonX (Freeware), installed
on my PC here and
I prefer STonX to Gemulator for most things. Hope this helps a bit!

```
#include <stdlib.h>

main(void)
{
while (1)
*((int *) (malloc(1000000))) = 1;
}
```

This is called a malloc bomb. It eats memory. Fast. Nearly every OS
in existence will go down in a ball of flames if you try it. Even those
that support copy-on-write die, because this writes (It'd work faster on
those if you malloc'd the page size (unless the copy-on-write algorithm is
no good), but they die anyway). Go ahead, try it; you'll discover that,
by your definition, most OS's out there are quite ancient.

From: mbecroft@tos.ak.planet.gen.nz
Message-ID: <HAWOEEUQUp@tos.ak.planet.gen.nz>
Source record: 129484

I am looking for software called "Hots MIDI Translator 3.7" (or similar name). This software is an integral chord harmonizing program.

I am also looking for "Digigram Big Band Plus".

I would like to hear from anyone who can help me to find the above software or who use that software.

Does anyone know if there exists a way to run Java applets on a TOS machine?
AFIK there exists nothing for TOS, how about under linux?

Any ideas greatly appreciated.

Sure, but not about CAF.

One of the problems I heard about was down to the hd driver they used
and not the AB040 (the disapering sound problem) it self. CAF works
just fine if you use the correct 040 driver _and_ harddisk driver.

Zero-X works as well and it's rather fast, even when runned in ST-RAM
(doesn't like Fast-RAM at the moment).

It is a .TTP thing, but not unfriendly. The program takes very few parameters, and the advantage is, it can handle all MIME messages. You just save a MIME message, header and all, and munpack does all the extracting for you. With mpack you can generate your own MIME messages, ready to be sent off.

If you prefer to operate from a GEM program, get Holger Weets' PackShell and install it as a tool.

# 1428. Get the Atari ST/TT/Falcon "Ultimate Virus Killer" TOTALLY FREE

Newsgroup: comp.sys.atari.st
Date: 1997-01-22 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.012297.160402.47@wxs4-15.worldaccess.nl>
Source record: 129491

Hi to all of you!

There is reason for some celebration! Since I started doing the "Ultimate Virus Killer" commercially, in spring 1988, I have personally sold 3000 disks (this is barring the sales through people like Oregon Research, CRL and Douglas Communications, about which I have no statistics). This morning I sent off the 3000th disk, which made me pretty content.
I'd like to celebrate this with all of you, so I am now offering all of you the opportunity to become a registered user of the "Ultimate Virus Killer" *for free*, yes, you read that correctly, at no charge! This means you'll be getting the latest version, 7.0, and you will be eligible to receive updates at a drastically reduced price.
Here's how to go about it (and a few conditions):

1) Send one formatted double density disk and 2 International Reply Coupons (3 International Reply Coupons if you live outside Europe) to "UVK offer", P.O. Box 67, NL-3500 AB, Utrecht. Instead of a disk, you can also add an extra International Reply Coupon.
2) Make sure it arrives at my P.O. Box by January 31st at the latest (!).
3) Only one free copy of "UVK" per address!
4) This offer does *not* count for people who are already registered users through me direct or through Oregon Research. It *does* count for people who have registered at Douglas Communications.
5) This offer does *not* count for people who live in the USA or Canada (contact orres@teleport.com to get your copy at a regular price).
6) If in doubt, or if you have questions, simply email me and ask.

The "Ultimate Virus Killer" is the industry standard virus killer for the Atari range of computers. It works on literally *any* TOS version, any hardware configuration, any multi-tasking system and "GEMulator" (and probably on any other good ST emulator such as Magic PC, Magic Mac and STonx, though this is unconfirmed). It recognises 98 bootsector viruses and 5 link viruses, and can restore the original bootsectors of almost 800 games and megademos. In total it can recognise well over 1800 different commercial and non-commercial bootsectors (viruses, anti-viruses, games, virus free disks, bootsector demos, etc., etc.).

Hope to hear from you soon...

> I used to love this game on my trusty old Dragon32 :)

There is actually a Joust clone (okey it's not exactly the same) for the
Falcon which is supposed tp be very good and have very nice graphics.
It's a french clone and I have tried the demo and it was good.

The main difference was the Joust have a rather small playing area (if I'm
thinking of the right game) while the clone has a _huge_ smooth multi
scrolling playarea with monsters and the lot.

Can't remember the name though.. I think it was reviewed in Atari World
and got a pretty high score (if I remember correctly someone thought the music
was _very_ good).

j > tried the Logic "upgrade", thank you, but prefer Notator. Can
j > you run Notator on a TT or Falcon. I found a place that has
j > both machines at a good price, but I am not sure about
j > compatability.

Very simple - get the TT. Notator SL does not run on a Falcon. And I've known people who use Notator on a TT and have found it to be excellent.

Too bad you didn't find Logic to your liking - I upgraded and have been quite pleased with the results.

>
> - If using HOWFAST, please also include your parameters on a second line

Hi, I've found that the speed of the drive very much depends on what
driver you are using for it. I compared ICD Pro 6.5.5 with HDdriver 4.5
using HowFast, and HDdriver was about 100-200K/s faster than using ICD.

Doing a test like this would be nice, but you should include what driver
is used with it as well.

Greetings,

Tomas

Java has no TOS support. Linux however has the FULL JDK-Java
Developers Kit available to it. I haven't used Java apps/applets
personally, but hear in the Linux newsgroups that Corel's new Java
Office suite runs slow.

## 1436. Retro fit floppy.

> will allow me to choose the disk format. Any information about this would
> really be helpfull.

You can use the "Floppy Configurator" from Double Click to set
the seek rate, turn your floppy off and on, etc. There are
a lot of great DC utilities out there.

I seem to recall reading that SuperBoot also had the ability to
set the seek rate at bootup.

For formatting your floppies, you can use "Dformat.prg", which
is in the "EXTRAS" folder of "Diamond Back" version 2.x. It's
quite possible that the "Dformat.Prg" is available as "Troutware"
(i.e., on BBS's and such). This will format 3.5" disks with
various DD and HD formats.

Another formatter is called "HCOPY" from Germany. This one will
format 3.5" AND 5.25" floppies with various DD and HD formats.

Hope this helps,

Randy Kwak

You can use a PC serial mouse but you'll need software to drive it. I think you can find the software in the various libraries, certainly it exists on Genie AFAIK and it was written by Cybercube as I recall.

What specifically is your Atari mouse doing? Could be you can repair it or better yet, buy an Atari specific mouse (i.e. Golden Image etc).

There are lots of step rate modifier programs, but I think SCSIwait might be
a real good choice (can't recall if NoRoach does this or not).

Formatting is easier, if anything. Hcopy.Prg or the HDformat.Cpx come to
mind immediately.

According to the DOC's for ICD's RATEHD program; it does not use a driver, it is intended as a hardware test. Why not use this program. It may not be the most accurate, but if everybody uses it, the results would be comparable.

Or, is there some problem with RATEHD, as it never features in the lists of SCSI tester programs?

## 1448. trouble with floppy drive

Newsgroup: comp.sys.atari.st
Date: 1997-01-22 00:00:00 UTC
From: lwright@silk.net
Message-ID: <5c5mq4$k6g@scipio.cyberstore.ca>
Source record: 129511

I've got a TT. When I write copy something to the floppy it seems to work alright, but when I try to load it again, the file is mangled. If it's a text file, it comes back with about 70% of the file missing, but in all sorts of places. I figgered the floppy was shot, so I replaced the drive, but to no avail. Could it be the drive controller? Next thing to change is the cable, but has anyone else had this problem?

Thanks,

Lawrence.

Sorry the ST only has 4 sound channels you need at least 16 to play
MIDI, A program called Cubic Player on My P.C. takes 128 Channels ! and
a 5Mb Instrument Bank to play MIDI. but if theres a MIDI file you
despiratly want to hear I can use my P.C. to convert it to SND, IFF,
SMP, SAM of WAV format which you can use on an ST but these formats can
be any size from 300kb to 20mb depending on the Quality you set it to
and the length of the music.

Well according to Microsoft Windows 95 on my P.C. the Nec 5D can do
resolutions up to 1280x1024 and vertical refresh rate of 33KHz - 60Khz
and Horisontal refresh rate of 50Hz to 90Hz so I think the answer your
looking for is 50 to 90 Hz, That will run fine on a Atari.

Great offer, and I'll definitely take advantage of it despite having a subscription with Douglas Communications. They still owe me four updates and I haven't received anything since UVK v6.6. Whenever I phone I'm told the latest version is about to be despatched, and yet nothing shows up.

What's the score with Douglas Communications, should I ask for my money back?

He's the author of SEE version 1137 - and the package appears to have been updates as recently as 4 Jan 97. There's a listing for an Fnet BBS in the archive:

ACORN BBS
Fnet Node 678
219-744-1396

But there's no listing for Rob Magdich in Fort Wayne, IN at Four11.com or Switchboard.com

I'd like to contact Rob to see if we can collaborate on another version of SEE that will support multiple graphics types and non-Fnet networking. IF you know how to get in touch with him (even if you can simply validate the mailing address in the SEE docs), please contact me.

I have the last version of HDDRIVEr with My JAZ on the falcon.
Everything works, even the passwrd protection. :)
The only problem non solved is the sleep mode. :(
Every 30 min, the jaz will go in a sleep mode.
I DOn't know if I can change that by hardware (jumper) or if the next
release of hddriver could include that. However, it is not that bad
that the JAZ goes into sleep mode, but under MINT/mintnet it is quite
annoying. Anyway, so Hddriver fully support the jaz. It is litterally
plug and play, It took me 5 min to install it and get it to work
perfectly..
:)

I doubt it will work with games. I have a cople of old TOS (maybe 1.2 and
1.4) in disk.

Before anyone complains, they were given to me by an Atari technician to
resolve some problems I had with a big screen monitor and spanish TOS.

## 1465. 720 to 1.44 meg floppie

Newsgroup: comp.sys.atari.st
Date: 1997-01-22 00:00:00 UTC
From: dwmoar@aol.com
Message-ID: <19970122034801.WAA14442@ladder01.news.aol.com>
Source record: 129569

I have installed the Ajax chip and a few support chips and a new 1.44 Teac floppie disk drive in my older Mega ST. I am currently running TOS 1.04 and have no plans on upgradeing to TOS 2.06. What I am looking for is a format program that will allow you to change the step rate of the floppie drive and format the disk to 1.44. The system can tell when a 720 or a 1.44 meg disk has been inserted into the drive. I just need software that will allow me to choose the disk format. Any information about this would really be helpfull.

dwmoar@aol.com

# 1469. Re: Atari clock/2000 AD

Newsgroup: comp.sys.atari.st
Date: 1997-01-23 00:00:00 UTC
From: "Alastair J. Houghton" <ajh8@doc.ic.ac.uk>
Message-ID: <32E73D83.167EB0E7@doc.ic.ac.uk>
Source record: 129372

Unfortunately, some ST owners *may* have more problems than others. The real-time clocks in the Mega ST range only keep two digits of the year. I suspect that this is true for some other machines in the range as well, and I don't know exactly how carefully TOS is written in this respect (I suspect that it will break).

As for the statement that the ST's clock stores four digits, this is total rubbish. It isn't stored this way at all; firstly, there's the GEMDOS clock, which is the one that most people use. This, like the XBIOS clock (actually the same thing, I suspect), stores years relative to 1980 in a bitfield. I think they have 5 or 6 bits to play with, giving a range of 63 or 127 years (if we're lucky).

There is also the keyboard controller's clock, which I can't remember the details of offhand, and the real-time clock in systems that support it. The RTC is different in the Mega STE and TT (and Falcon) to the older one in the Mega ST, but I believe that they store the year as a two digit BCD number (the digits being available separately from memory).

So we may have a problem.

Not at all.

> Your best bet is to format a PC disk on the mac, copy the Atari files
> to it and re-read on the mac.

No. The PC should read them. If it doesn't, then you should get a
decent BIOS that actually uses the disk controller correctly; the
controller will be quite happy to read the sectors off the disk in
an interleaved ("twisted") format; just because it sounds wierd
doesn't mean that the PCs don't like it. I have used many "twisted"
or otherwise fast formatted disks in PCs, some of which produced
astounded gasps from the owners of said machines when they read/
wrote at about four times normal speed.

Hello,
I am looking for a dump of a TOS 3.06 (canadian-french or english) to test
it on my PAK3 card.
If anyone can help me, that would be great.

PS: please don't tell me it is illegal because of copyright stuff, I just want
to test it!

HACE invites all Atari users to the seventh annual Houston Atari Safari.
Safari '97 is primarily a sales show, with plenty of old and new software
and hardware for the ST/TT/Falcon computers, Atari 8-bit computers and
Atari Lynx and Jaguar game systems. Major Atari vendors who will be at the
show include:

BRASOFT - Derek Mihoka with Gemulator 96, PC Xformer
ChroMagic - ST/Falcon hardware interfaces, ST MIDI tutorial software, ST game software & ST utilities
Crawly Crypt - ST shareware & PD CD Rom disks, CD drives
4Play - Battlesphere Jaguar game
ICD Inc - ST SCSI host adapters, PC Snap Dragon digitizer
It's All Relative - PhotoCD viewers, Genealogy software, CD's
Systems For Tomorrow - lots of commercial software, TT monitors
TOAD Computers - Jennifer is bringing lots of commercial software
Trace Technologies - FlexMenu/FastPath, Squish II, other ST utils

Safari '97 will also have a used hardware/software area composed of Atari
user and "ex-user" individuals.

Safari 97 will be held at the Four Points Hotel, 7611 Katy Freeway in
Houston Texas. One day only, Saturday - February 22nd, 1997 - 10 am to 5
pm. Admission to the show is $5 (only 1 dollar for kids 12 and under).
Vendor tables are available for $20 per table.

---

Table Reservation Form for the Atari Safari '97
Fill in this form and return to the following address so that it will be
received in Houston no later than 15 February 1997:
HACE ~ PO Box 820335 ~ Houston TX 77282-0335

NAME: _____
COMPANY: _____
ADDRESS: _____
CITY, ST, ZIP: _____
Do you represent a Dealer or Company? .. Yes No
Number of tables Required? ..... Yes No
Do you need an electrical outlet? ..... Yes No
Will you have any special requirements? (describe) _____

---
---
$20.00 X ____ (number of tables requested) = _______ Amt due HACE
Make checks payable to HACE.
THANK YOU FOR YOUR PARTICIPATION!

Yes it is still being published.. although the last issue was a bit
late, and many of us received it only a couple of weeks ago.

They have moved ISP, but I do not have the actual CN web site URL. You
can find the TAF pages (affiliated in a sense to CN) via

http://www.interlog.com/~schrist/

Oh, CN have also moved to Interlog...

I think it's a pitty that no one has written a program like this for the
Falcon ages ago. There are several good trackers supporting up to 32 channels
of sound. Why not base midi player on one of those and make a complete music
station? If I could, I would have done it a long time ago.

I still have the hope that one day someone will write such aplication for
the Falcon.

Source record: 129381

Here is the situation:

I run PUBLISHER ST and I have an Atari SLM804 Lazer Printer. I have no problems with the program except when it comes to printing the file. I set it up for a PostScript 300 dpi printer. I go do a print, and I select Print to Disk (since that is what they recommend). I then exit after this is done, but then I goto the program USCRIPT to print it off. It can't find the file and when it does, the printer doesn't recongize the fonts. Is there an easier way to print to the printer? I have no problem with doing a screen dump to the printer (I have a program that sets that up in my AUTO folder) and also text files in a .TTP file that does that. ANYONE KNOW WHAT TO DO?

Hmm, but what about the ATW800? The basic model (one processor) is probably more powerful than a TT and a fully loaded one will definitely knock the serial ports off it...

>and several were purchased by NASA

Yeah?!? Where did you hear about that?

> for use in designing the Space
>Shuttle

What do you mean by this? The Space Shuttle has been around for years longer than the TT and as I recall (from an official company annual report) the shuttle was designed by Rockwell International. Do you mean TTs were used to design some kind of subsystem or what? Perhaps they had them in the shuttle so the astronauts could spend their free time writing music, raytracing or DTPing ;-)

CSB was not Dungeon Master 2 - it was basically a set of new levels for the original game. Dungeon Master 2 is only available for the PC, and features (supposedly) much improved artificial inteligence for the baddies, but appart from that, is not really a huge improvement over the original game. This is a shame, because they could have done a lot with it using newer 3D graphics techniques...

Erm, are you absolutely sure about this? I remember that Atari threw a wobbly
when numerous sources (e.g. PD libraries) were assuming that programs such as
NeoChrome and Joust were PD, when in fact they were not, and it did clamp down
and banned a whole list of programs from free distribution. So when did Joust
attain PD status?

Strange !!

RATEHD will skip drive #6, because that's where ICD have a clock on some
of their host adapter boards.

I find it skips a drive when there are cabling problems, like an intermittent or
poor connection on one of the 50 pin IDC headers connecting to the drive.

Did you just luck into that, or did it come to you in a vision?

BTW, it's amazing to me that someone could write a hypertext help
file then not put any (well, hardly any) useful information in it.
Apply filter? Batch? About the only thing of use is the
description of the Options menu item.

> either A or B drives at all. what obvious thing am I doing wrong?

If both drives are "on" as soon as you turn on your ST (i.e., both
floppy lights are on), you have to get your lines and jumpers right.

If both drives are "off" and are scanned like usual during bootup,
it sounds like you may have a terminating resistor on your B drive.
Depending on the make, this may be a large (usually blue) chip that
has to be pried out of the socket OR a jumpered point labelled T1 or T.

Hope this helps,

Randy Kwak

## 1493. Re: Java

> Java AWT.

Not for point #4. I have linux Slackware96 installed and it no longer contains or requires anything from Motif. It uses a Motif-alike that is sanctioned by the Free Software Foundation so Java is now able to run with a simple patch. Actually when I installed Linux Java was pre-installed when I installed the "N" disk set i believe!

## 1494. PPPkit config questions

Newsgroup: comp.sys.atari.st
Date: 1997-01-23 00:00:00 UTC
From: caesar@nwlink.com
Message-ID: <5c85gj$mbb$1@texas.nwlink.com>
Source record: 129397

After about a year of hesitation, I took the plunge and downloaded PPPkit this morning. So far, it's been easier to install than I expected (phew). I do have a couple of questions, though.

First, in the document that comes with the software, I find the following sentences:

"Open a window on U:\BIN\. Install the application
SH.TTP and give it 'SCR' as document type. Change the
path of this window to U:\CAB\. Open a new window on
U:\ETC\SCR\."

Well, I opened the window and installed the application. But this whole window path changing thing has got me just a bit confused. Can someone who is familiar with the kit elaborate a bit for me?

Second----well, I'll get to second later, after I figure out first.

May your mighty Atari brains rescue me again!

Joel!
Seattle, Washington, USA

Aggggh! Typo (as in "did I really type "Shuttle?"") - should be "station" -
and we all know what Congress did to that concept. %^<

>..the shuttle was designed by Rockwell International.

Correct.

>Do you mean TTs were used to design some kind of subsystem or what?

Not certain precisely what was being designed, but I do know they were using
the TT-high-rez mode on 19-inch monitors for CAD work of some kind.

>Perhaps they had them in the shuttle so the astronauts could
>spend their free time writing music, raytracing or DTPing ;-)

Hmmmm, probably not. Many of the Shuttle's computer systems were originally
based on the Apple-II, but I think most of them have been replaced with
Intel-based systems (probably 8086's knowing how "advanced" any government
project is likely to be).

>>and used in Denver, CO until recently (how many of you guys knew
>>that?).
>
>I certainly didn't! Please tell us more!

Well, I just did. Wish I had more info, but what I have is from memory, adn
that's rather spotty these days.

No problem. I have the MSTe and TT030 at home, and can call my sons and get
either one of them to run the specific checks on their old-model Mega; but
there definitely is no problem with the TT030 for the next 40 years or so.
If I get to be more than 86 years old, I may start worrying about it then.

By "setup" I presume you mean an external MIDI isntrument - and the answer to that is, MMM will play with the internal Yamaha sound chip, or with an external synth, or both (though why anyone would use the Yamaha chip when they have a MIDI synth is beyond me).

I was wondering if there is a way to install an game onto hard drive that is not meant to be installed on a HD.... The game in question is Wizard's Crown.... My nephew would like to install it to the hard drive but can't seem to get it to recognizes the second disk... Is there a program for the Atari kinda like an installing program that would install Wizard's Crown and other game that were not meant to be ran on a hard drive? Thanks for any advice,

Jason

There is one program I've seen that might work, it's called Divert, but
if you
must swap disks, I don't think it will work, seems like it was mostly
designed
for applications which are programmed to think they can only run from
the
floppy drive "A", regardless if there's a HD on the system or not.

You could run this prg, and it would redirect the calls for files to the
HD vise
running to a slower floppy. Plus, many of these older games had some
type of
copy protection on them to prevent (or slow) software piracy.

You asked what cannot be written at the application level and I told you. I
am not claiming that any particular technology is best implemented in
supervisor code.

> Those that do are attempting to supplant big iron.

And doing it successfully. There is no reason to not run a program that needs
a few hundred megs of logical address space on a decent microcomputer using
a decent OS. I don't include the Mac operating system here.

> Howso? They both have to deal with the same locality issues.

VM has a lot of hardware support for keeping track of page faults and page
touch frequence/recency to pick victim pages. If you wanted to use that
information in a disk caching algorithm then you would have to do it
in software which would be much slower. Most "modern" operating systems
(such as NT, IRIX, UNIX) use a good hardware supported VM scheme and
a simpler disk caching scheme. Also remember that each time you read
something from a (non-memory mapped) file you are invoking a function that
will have a lot more overhead than simply accessing a memory address.

> That which is commonly used would be covered by MPEG.
> Even the rest which are often touted and less often seen
> would be covered by other formats (like vrml).

MPEG is a video format. QuickTime is a video engine. They are not directly
comparible. For example, it is logical to ask "Can QuickTime play MPEGs?"
(it can) but it is silly to ask "Can MPEG play AVI files?". QuickTime
adds a great deal of functionality to your computer. It allows you to play
back many animation and sound formats, it can control MIDI devices and it
can control video digitizers. This gives programmers a powerful API to
create multimedia applications. I wrote a digitizing program for the
Mac once and the digitizing component was only about a fifty lines long.

> .prgs .accs which need to be available for different applications.
> eg. STiK needs a cookie jar extender. Does anyone know the best way
> to run superboot with MagiC ?
Dunno if its the best way, but it's how I do it!

The first file in my AUTO folder is my Clock followed by Superboot prog,
then is the magic booter, followed by everything else and then the second
Superboot prog.

This works fine, Superboot is not called up when the computer resets
for MagiC as superboot hasn't reached second prog, so just carries on
happily setting up everything else as you'd expect.

If after booting with MagiC you wish to use the computer without it,
you'd need to turn machine off, as reset of course leaves MagiC in
memory.

Hope this Helps,
Ade.

: .
: In this picture ! represents a jumper connecting two pins.

: What should the proper jumper configuration be so that it will run with 16
: Megs?

The TT RAM chips must be 30 pin 1Mb or 4Mb x 8 non parity SIMMs.
^^^^ ^^ ^

If you have one of the newer TT RAM boards it will have 6 jumpers
labeled w101 to w106.
The jumpers settings are as follows:

w101 w102 w106
1M x 8 SIMMs (4MB) 2-3 2-3 2-3
4M x 8 SIMMs (16MB) 1-2 1-2 1-2

jumpers w103 & w104 are for the start address remain the same 2-3
jumper w105 is burst mode ON 2-3 OFF 1-2

No, actually, it won't. You appear to have mized up the horizontal and vertical refresh rates, but that doesn't matter. In order to display ST medium or ST low on an ST(e), the horizontal refresh rate must be able to go as low as 15 kHz, which, it appears, the 5D isn't able to do. ST Hi should still work, but it's something of a waste using a monitor like that for one resolution only.

Sounds very much like Nemesis to me. So why would you *want* to put Nemesis
on top of it? Nemesis speeds up the CPU and BUS to 24mhz, DSP to 48mhz and
the FPU is also increased but I can't remember what to.
Nemesis is about $100 so seems like a much better deal to me!
Nemesis allows you to use 640x480x256 and seems faster than a standard
Falcon running 640x480x16.
Nemesis also allows 640x480x65k which seems to perform faster than a
standard Falcon running 640x480x256.

I've got one and I'm *very* happy with it :)

For info see: http://www.ourworld.compuserve.com/homepages/TITANWEB/

That's all very well, but I think what Papyrus 4 (at least v4.25 I own)
urgently needs is a decent GEM/3 import filter. It's a shame color GEM/3
files from Kandinsky 2.x or even PC's can't be imported!! GEM/3 is the
GEM standard color vector format, and a package like Papyrus should
support all its versions. It also would be nice to be able to import
CVG 1.1 vector files, which are almost the de-facto standard for TOS
computers.

I missed the original question, but as long as the ST disk is in IBM-format, the Mac will be able to read it provided you have PC Exchange installed. PC Exchange came with your PowerBook (and has been shipping for a long time) so you already have it. If the ST disk is in some funky twisted format that only the ST can read, I don't know what to suggest other than using the ST to copy the files to a standard-format diskette.

Yes, but if it won't synch "down" to 15.75, it won't be able to do the RGB mode on the Falcon-just VGA modes... and IMHO, a Falcon that can't do RGB is mucho crippled for a lot of software. Go with a NEC 3D, or other older model multisynch. Systems for Tomorrow sells the NEC 3D for around $275.00. You can reach them via E-Mail: sft@sound.net (I think) Another (distasteful) alternative is to buy an Amiga monitor from AmiTech... The A1200 is in the same boat as the Falcon when it comes to older/newer software and they have some multisynch monitors that cover it. They sell a 14" for around $450.00 and a 17" for $750.00... Good luck! ;)

What fonts are you using in Publisher? Do you have the matching or substitute fonts for UltraScript? Are you printing to disk with a *.PS name? Have you setup UScript properly? What message(s) is UScript giving you in refusing to print? Do you have the SLM printer driver for UScript?

Details man, details! Get back to us - glad to help if we can!

No idea, you might like to try their respective websites' developer section. Netscape in particular does it though. You only have to look through one or two of the binary groups to see the amount of spam which contains HTML code to suck users into dodgy porn sites as soon as they open the message online - presuming they're using Netscape as well, that is.

ATB, Frank.

Hi,

The following ST items are still for sale at reduced prices.

Email if interested. Thanks!

```
************
* HARDWARE *
************
$50 Marpet Xtra-RAM - Includes *4 MEGS OF RAM*, disk and manual.
$35 Adspeed ST - 16 Mhz accelerator. Includes disk and manul
$30 SM124 monitor - Monochrome.
$30 SC1224 monitor - Color.
$17 AT-Key - Hook up any PC keyboard to your Atari.
$17 Overscan board - This is a hardware board that will remove
the border around your screen and give you more screen pixels.
Includes disk and manual. (Not STe)
$8 Clock Cartridge - Includes disk
$3 ST Power Supply - External 'brick' type
$3 3.5 Power Supply- External 'brick' type

************
* SOFTWARE *
************
$17 NeoDesk 4 - Includes manual
$17 AtariWorks - Includes manual and SpeedoGDOS.
$8 GFA Basic 3.6 - Includes manual
$4 UVK 6.4 - Virus protection, includes manual.

*********
* Games *
*********
w/box and manual
$9 Chaos Engine - By Bitmap Brothers
$9 Magic Pockets - By Bitmap Brothers
$4 Torvak - By CORE
$4 Doodlebug - By CORE
$1 Wanted (Gunsmoke)

disk(s) only
$9 GODS - By Bitmap Brothers
$4 Wolfchild - By CORE
$1 Alien Syndrome
$1 Captive
$1 Leander
$1 Star Wars
```

$1 Rick Dangerous
$1 Battleship
$1 Strider
$1 Dynasty Wars
$1 Tiger Road
$1 Black Tiger
$1 Last Dual
$1 Night Shift
$1 St Dragon
$1 Turrican II

How do you set colors in Pagestream? I've been using 2.2SE
for a while, now that I finally convinced it to remember font
paths. My testing shows that you can only set colors for the
current session. Its sporadic when remembering the settings
next time. It is also sporadic in changing colors of objects
at bizzare times, such as playing with fills. I find that
to set RED, I usually have to start with Yellow.

MichTron is also way out of date - it only supports 2400 and below
modems, and only offers x and ymodem downloads. It's not
Fido-networking-compatible, either.

HDDRIVER 6 does support password protection for JAZ drives. It's the
same option that is available for ZIP drives. ZIP and JAZ drives are
compatible in this respect.

If anybody has information on how to configure this feature (i. e. the
vendor specific SCSI commands needed for that) I might support this in
upcoming releases.

No because TOS lacks a lot of the basic features needed for implementing
Java.

> AFIK there exists nothing for TOS, how about under linux?

Under Linux you can get Java running if you

1. Get the Java JDK sources from Sun (no fee for non-commercial use)
2. Apply the Linux patches to them and compile them
3. Make additional processor-related patches (a few lines of Java source
code are written in assembler language)
4. Get your hand on the Motif sources (unlikely). You need Motif for the
Java AWT.

I've seen this on a ST.

I thought the floppy was faulty, but it turned out to be a cable problem.

The atari TTFAST ram board (CA401058-xxx) uses 30 pin SIMMs.
The SIMMs may be 1M x 8 or 4M x 8 (9 bit SIMMs may also be used).
All 4 SIMM slots should have the same type (ie. 1M or 4M).
1M SIMMs give a total of 4Mb of fast ram, 4M SIMMs give a total of 16Mb.

The jumpers required are as follows:
SIMM type jumper W101 jumper W102 jumper W106
1M x 8 2 - 3 2 - 3 2 - 3
4M x 8 1 - 2 1 - 2 1 - 2

Starting RAM Address jumper W103 jumper W104
$0100 0000 2 - 3 2 - 3

Address Mode jumper W105
NON-BURST 1 - 2

BURST 2 - 3 (default)

:
: The fact that Apple had models in the 80's which initially retailed for
: more than $5000 (some were closer to $10000) does not mean that they had
: an "academic mentality". It means only that they were targeting a much
: different market than Atari. IMO, it was a mistake for Atari to ignore
: that market, since targeting it would have given the ST much more
: credibility as a serious computer, as well as ensuring that Atari kept up
: with current technology instead of falling far behind like it did.
:
First...Atari felt it was making a good move...because in 1988 they
went for the one market every one else was ignoring. The home user!
Texas Instruments and Atari battled it out for this market early on...
then came the C64. Next thing you know they all pulled out and left
the market wide open. Atari simply couldn't afford to secure it...even
thoe they gave it a try. At the time...the ST was the absolute BEST
machine on the market for its price. I was running DOS and windows
applications on my Atari, along with a great deal of Mac stuff (Both
faster than the native machines I might add!), and saving
my data to 3.5" floppys (two or three years later before this
became standard on PCs)...running in full color, doing midi work...
and much much more when my friends had paid up to 4 times the ST cost
for an Apple GS, an XT, or the occasional (very rich) Mac user (and
scraping to afford a simple MPU...let alone midi interfaces and sound
cards). Today...I can still use my ST with only 1meg and do things that
it takes a current Mac or PC at least 12meg of RAM and an awfully large
hard disk to accomplish. So maybe TOS/GEM is old and outdated...but
it's sure outlived the others when you consider it's only gotten four
or five slight modifications, and DOS/Windows/SystemX.XX is constantly
getting major plastic surgery just to make it useable.

Atari fell behind in technology?
Interesting that they hit the market first in many many areas...all the
way to the last product...the Jag. Falcons came out when Pentiums were
still a wet dream...In my opinion, Atari's big problem has never been with
the machines they made and their respective OS. Axe to the grind stone...
the Atari machines WORK with less problems than any other machine I've
ever come in contact with for average (and some not so average)

applications. It's really not fair to compare the latest stuff that just came out last year with stuff that came out 5 years ago (Falcon...longer for other Atari stuff)...and even so...the Atari CAN and DOES do most current computing needs. That's pretty good for a platform laid out in the early 80s!

The "few" dealers that carried Atari sold the hell out of them. The problem was that no one can see into the future. Trimmel was one major player who saw much success in making a good machine for cheap, and selling it in mass quantities (I.E. C64). He took a gamble with the same policy on Atari. The problem...by this time...free publicity was no longer existant like in the C64 days when editors lined up and begged to review the hottest new gadget. He didn't figure this into the equasion, and Atari no longer had money to push their lines. Furthermore, there were evidently some big jerks down in dealer support that managed to piss off the majority of local small Atari dealers...there went their last hope! Shortly, mail order and whare-house whole sale ruled the PC world. Now...I think it is basicly a matter of luck, and this time around Trimmel's seemingly logical move at the time lost. It easily could have gone the other way however...one never can tell...you make your best call and hope for the best.

Okay...are the Direct Computer Clones a good choice?
For a lot of applications...yes...
I doubt Direct Computers expects to sell a whole lot of these...espically to "home users". The people who will buy them are power users who might already have lots of TOS software. Or someone wanting to market a particular nich package based on the platform. For instance...
Say I'm a company who has been working on a project for the last ten years to make a machine to co-ordinate satellite uplinks. I already have ten years worth of code that was written in 68000 assembly language but just now are ready to select an existing machine to build the rest of the system around and go to market within the next two years.
I make a few phone calls...
I'm down to choosing between a Mac mother board, and the Direct TT. Mac is all out of the particular one I need...the next model up that they will sell me without a chassis and other junk I don't need is going to run me about $1,000,000 more in the end, mainly because I have to get a special commercial liscence to resolve some crazy legal problem with software drivers for the networking card I want to use that'll zap a whopping %15 royalty for every unit, or upgrade I sell. Going with an Intel set up means rewriting all the software at the expense of 10 years of work and research. (these are hypothectical but realistic instances here...so please don't fire specific flames here).

I call Direct computers, and they say they can make a run of the exact number I need, hack off what I don't need, and add what I do, and even make a bid on doing my final chassis for the ENTIRE system if I want...my lawyers say we're good to go with developing or obtaining everything we need for the platform without running into problems...Etc..Etc..Etc.....the machine meets my specs...so I buy about

two thousand of them and contract to buy a whole bunch more over the next 5 years!

This will eventualy happen for Direct's TOS Clones if they hang in there and get some good sales people at hand to search out this demand. This kind of thing happens every day...I see enough nich hardware in the TV station I work in to know this is a fact. We've graphics systems that are based on VERY old technology...but they work better than anything else avilable. They are VERY EXPENSIVE...but the companies that made them have made decisions that most of us can't even imagine...usually resolving around legal and liscenseing issues. Believe me...if a company finds out they might be able to save a big bundle by going with TOS over some other system...they will do it! I've seen quite a few "industrial" computer manufactures pop up under similar circumstances to the TOS Clones at Direct TT. They've a good product on their hands...there's lots of applications that this machine is perfect for...and given a decent quanity to make a run of...it's very possible one could save big bucks going with the platform.

Oh, and by the way...Atari sold a lot more industrial computers than most realize...I've no idea how many...but every-where I go...I see these babys poping up in the strangest places!

Brian

I was just wondering if anybody has Application and Design Softwares' Universal NETwork setup on 2 Atari's and what their experiences with it are... Specifically, I'd like to link 2 Mega 4's (TOS 1.04), both running at 16 mhz, and have them accessing one printer/hard drive and each with one phone line for BBS service. Thanks in advance! :)
(oh we have 2 Pioneer 6-pack CD-changers as well...)

What on earth does this have to do with Atari ST computers?
I know a lot of music people are going crazy about getting TB-303s, but
that's not a good enough reason to post to groups that aren't relevant to
music. Try the "rec.music.makers.synth" newsgroup instead.

You can get the programs you need at my site:

ftp://ftp.sn.no/user/hallvart/atari/

53K hcopy17s.zip Hcopy 1.7- disk copier/formatter (MSDOS!) HD disk support
1K hd_fdc.zip Step rate changer (3ms) for TOS 2.06 (Auto program)
4K setseek.zip Configure steprate (2/3/6/12ms) (Auto or normal prg.)

Good luck!

I've had no major problems using "Connect" with VT-100 emulation.
I use "Emacs" a lot as an editor on the UNIX machine I'm connected to
when I'm online and it works just fine.

>
>Good plan. Where can it be found?

I found it and downloaded it yesterday from:

ftp://ftp.cnam.fr/pub/Atari/Archivers/pacsh263.lzh

I had a little trouble finding out what Jos meant by installing it as a
tool, but found out that you have to:

-double click on the drive icon where the "mpack.ttp" and "munpack.ttp"
files are and locate the folder where they are.
-"move" those two files into Packshell's desktop.
-By double-clicking on these two new icons you're able to set the paramters
for the .TTP files. As for naming the mpack/munpack.ttp files, for some
reason you're only able to give them 5 characters!?!?! Perhaps it's a
limitation of the pre-registered version of Packshell.
-Save the setup

Don't ask me which parameters they should have and how a file is to
actually be MIME-encoded/decoded... these UNIX "man" pages are pretty
cryptic, so I'll probably continue experimenting some more with the whole
thing. But please- if anyone knows how to "install" these .TTP programs
within Packshell I certainly won't complain ;-)
I'm also trying to figure out how to install the UUencode.TTP and
UUdecode.TTP programs with it... (and yes- I've tried all sorts of
combinations based on the manual, but I can't get it to work).

NEWSie uses the id from your e-mail address upto the '@'.
So NEWSie is sending: Pierre-Yves.Joyeux as your userid.
However, if it says invaild password, thats what it means.

You can also enter the password manually if you change the setting in
the Mail Preferences to NOT 'Use Password', NEWSie will prompt at
connection time.

OXO said to all @ http://www.oxo.ch/web_gb.htm

Hi All,

Well, who is going to be the first canard in the pond? My vote is for
everyone's favorite French speaking Atarian Kathy Ellis <g>. Kathy, if
you say this Ducky is OK, I'll get wet too :)

I've been using CAB for almost a year now and I'm happy with the results.
I would like to have two good browsers to work with on the Net. The new
version 1.45 looks good, but...

If I do purchase Webspace for 60 bucks US, I'll also donate the same to
the CAB developers, freeware or not. So, if anyone takes the plunge,
please post the results.

All wet in Seattle,

Charles

Frankly, it might not be so bad to see Atari/JTS in court. It would be
the most action that atari owners had seen out of their former company
in years. :-)

If atari actually came out of the woodwork to do anything, which I
sincerely doubt they would, perhaps they could answer why they sold me a
falcon and then immediately abandoned all support for it. Why they gave
me such a screwed up version of Atari Works (parts of the manual upside
down) with a coupon for a free upgrade to version 2 (I keep it under my
pillow at night so I don't lose it).

And why they sold me a jaguar and then dumped it out the window after
everything else.

Sorry everyone, for venting (I love the platform - hate the company). I
just can't for the life of me imagine JTS/Atari coming out of the
woodwork and trying to prosecute a handful of people who represent
the hardcore of atari enthusiasts, trying to keep the platform alive.

If this mysterious JTS representative wants to respond I would love to
hear why I can't get a diskbased tos unless I own that particular tos,
but I can, purchase thousands of dollars worth of hardware and software
that is now worth about $1.50 Canadian (on a good day).

Like I said, sorry for venting. I'm usually not so negative, but this whole illegal tos deal gets me going. I realize the copyright law is on the side of atari, but I believe there is a moral and ethical law here too.

And Atari broke that moral and ethical law to us users a long time ago.

Tom

Try the rather spiffing program 'Fastcopy' or 'Fastcopy Pro'. Both of
these programs allow you to change the disk drive step rate, and format
extended disk formats (Both DD and HD: Last night I formated a 720K disk to
940KB!).

Hi fellow Atarians,

Does anyone know how to split a _stereo_ .AIF or .WAV into two mono files
on an Atari? One for the left channel and the other for the right channel.

Any help or ideas would be greatly appreciated.

# 1578. GEM mentioned in MACWorld

Newsgroup: comp.sys.atari.st
Date: 1997-01-24 00:00:00 UTC
From: Thomas Main <main@conrad.appstate.edu>
Message-ID: <Pine.PMDF.3.95.970124143410.643830640A-100000@conrad.appstate.edu>
Source record: 129345

The Feb. '97 issue of MACWorld features an article on the BeOS and its potential for Mac users. As I was skimming through the article, I saw reference to GEM! The writer was wondering what would happen to the BeOS if Apple didn't use it or part of it for the next release of MacOS and theorized that it would end of with other OS "wannabees" like OS/2, AmigaDOS, NextStep (ironically, NextStep IS now being considered by Apple), and (ta-da) GEM!

I thought it was kind of neat to see a reference to our OS (though, properly speaking, GEM is only part of our OS) in a major publication nowadays.

The article also made me realize how untimely print publications can be. Apple stopped considering BeOS a while back, but there it was as Feb. cover story!

Anyway, it is a neat article about the BeOS (which I'm sure will survive Apple's misjudgement) and is worth a look.

-Thomas

## 1583. what is needed to run caf in high resolution?

Newsgroup: comp.sys.atari.st
Date: 1997-01-24 00:00:00 UTC
From: roedaal@audiophile.com
Message-ID: <32ec3103.19728740@news.univie.ac.at>
Source record: 129350

Hi!

I'm asking myself if I couldn't make life easier for my eyes... I had an excellent oppertunity to get a 21" monitor and did so.
But for now, I am not sure how I can achieve a satisfying resolution, such as 1024*768, or, if ever possible, higher, with my Falcon.
What I am owning at present (Screen Wonder Pro) doesn't like Cubase Audio. The screen starts to "flicker".

Is there a hardware solution that can do high resolution with CAF, and maybe even expands the RAM?

Thanks in advance for any hints to arrive,

Chris

Parts of it are owned by Atari, and parts are owned by Digital Research.

## 1585. Thing Windows?

Newsgroup: comp.sys.atari.st
Date: 1997-01-24 00:00:00 UTC
From: bp507@torfree.net
Message-ID: <E4IzIy.CBn.0.sheppard@torfree.net>
Source record: 129352

I've been trying out the demo of the Thing replacement desktop, which looks very nice, but I have a couple of questions that don't seem to be answered in the docs.

Some earlier posts suggested that the icons can be edited with a program called INTERFACE. Is this commercial? I haven't been able to find it on any ftp site.

Secondly, and more importantly, the whole program freezes when I try to open a second window (folder or drive partition). Is this something that is disabled in the demo or what?

Thanks,

>attain PD status?

Hmmm...I assumed that it was a PD version since it said so on the title screen, since Joust could no longer be sold commercially. I found it on a CD-ROM full of ST programs. I've also seen the orginal Atari version and it had a different intro screen.

As for NeoChrome, there is a "PD" verison called NeoChrome Master which is a rewrite with newer features.

So far JTS, the company formally know as Atari, would still hold the
patents and copyrights.

Unless it's needed for a game, Magic is much better for having a
multitasking enviroment. :)

AFAIK, the only way to get filtering on the ST at this time is to use
NOSPOP3 with Oasis 1.45; all of your mail and newsreading will be done
off-line in this case. NOSPOP3 supports either static or dynamic IP
addressing under PPP, but only static IP under SLIP.

I'm working on a backward-style article killer for Newsie that would let you
"read for offline" and then run the killer to delete articles which fir the
criteria you select; but that's really only a stopgap until John gets a real
killfile into Newsie. It would be much better to NOT waste time downloading
things just to delete them.

Excellent article. I must admit, this was the first news I've heard
of Atari's demise, and I am truly sad to see it go. Other than the 2600,
which almost everyone had, my first exposure to Atari computing was only
5 years, when a friend talked me out of buying a COmmodore 128 in favor
of a 1040 Ste. He's long since switched to a Pc, but I still hang on,
even now that I've upgraded to a Falcon.

To some great years, and a lot of fun with them, Goodbye Atari :(

From: bjr@edison.ebicom.net
Message-ID: <5cbdi4$1am@einstein.ebicom.net>
Source record: 129363

Aloha,
I just hit the OXO WebSpace WWW page and grabbed the demo...
Looks pretty good...but other than being a "Whole Lot" faster, it doesn't really look any better than CAB when it comes to supporting spiffy pages and the like. So...I have a few questions concerning my particular experience with WebSpace and wonder if the full paid version behaves the same.

1. Sometimes I would load html pages, and sections of it would get clipped off the left side of the window...the scroll bars didn't help.

2. Several tables that I loaded didn't align properly...the word(s) of a particular field often didn't sit in the appropriate box...usually about three letter spaces to the left.

3. A lot of things simply refuse to center...and always are flush left when they are clearly supposed to be centered. This problem was most obvious on header tags and things (I.E. a gif) that was meant to be centered in the field of a table might show up flush left in the top of the field.

Over all I'm very impressed with WebSpace!
This thing books offline! Faster than NetScape on the 486DX66 back at work! My questions are...

Have these things been adressed and fixed in the full paid release?

Could we get a full listing of the HTML tags that are supported on the OXO web page? Or if it's easier...the ones that are "not yet" supported?

Are the problems mentoned above "My Fault"? Maybe I missed something.

Please don't flame this article...
I know how hard it is to support what is left of the Atari community and I applaude OXO for Web Space. Once I know what I'm getting...I'm pretty sure I'll buy it. I'm just a sucker for details :) My impression so far is that it's most likely worth a try...but don't toss out CAB! You'll most likely need both for a while longer, and between the two... you should be in pretty good shape.

Thanks,
Brian

Yes, it's illegal. Probably no one will sue over it, but technically Atari (as embodied by JTS) still owns the copyright, and if Wizztronics or whoever does manage to purchase the rights, they probably would alos obtain the right to legal redress. C-Lab has a license to duplicate TOS, and it's cheap and easy to buy a used (even a broken) ST with TOS chips in it, so if someone were to do that, legally making a copy for themselves falls under "fair use." Technically, it's illegal for someone else to make the copy from ROMs not owned by the guy who's going to use the image - but that's such a tiny quibble that I think most judges would laugh it out of court, even if the copyright holder did sue.

So, to make a long story short - sell 'em a broken ST and give them a TOS image on disk that was taken from the ROMs in the ST. <G>

I ran into that, too, Frank, and IIRC it was solved by fiddling with the
"unload Thing before launching" settings, though I don't recall exactly how.
Also, using the mouse to open a second window still worked when ALT-<Drive
Letter> didn't.

The demo has me sold. I finally have a desktop I like better than Teradesk.

>
>Any ideas greatly appreciated.

Well, so far there are no way to run Java apps under CAB....but there is a way that someone could have the same type of programs for TOS.

Perhaps the person who has an Atari related web site could whip up a little TOS program that can be run from CAB after downloading. Quick animations, MOD music, or automatic sample playing are good examples.

They can't be zipped of course, but using Ice Packer will make the D/L easier. I hope this will inspire someone :)

TaxWizardII+ is almost ready for shipment. This program covers your USA Federal Tax Return and comes with more than 38 forms to handle your individual or sole owner business return. Works on any Atari TOS based machine and is compatible up and down the model line.

TWII+ does all the math and interfacing between forms for you. Simple to use, with everything happening automatically. Retail $49.95 plus $3 P&H or second and subsequent buyers receive a $10 discount on the updated program each year. Comes complete with all forms supported by the program so that you have ready reference in case of a question.

We will ship by January 30th, so reserve your copy now prior to our production run to avoid delays in receiving the program.

Email w/charge card info and mailing address, or fax us with the information and we will be sure to reserve you a copy.

SPECIAL FEATURE THIS YEAR...We have an in-house tax advisor available to answer your tax questions either by email or fax.

This is one reason to try and find an ISP that not only has SLIP, but also has a dial-up shell account! With the shell account you can use the kill file in TIN whenever something really annoys you or this group gets a mega spamm like last time! I normally just use PINE for all my e-mail and newsgroups, but when we get a situation like we had a while back, I'll fire up tin first to weed out the crud, then go on and read the good stuff with Pine! I hate Tin's interface (Old IBM style command line crap).

i'd love to have directions on how to create a null connection between an Atari 1040stf and a Mac. Can it be done? I need explicit directions. Please help me!!!! I have both computers right next to each other. do they both need a modem? I have them both with modems. I've never done a null connection so please be gentle with me! Any suggestions and advice is appreciated in advance. Thanks

>for. Please define "killfile" in a way that I can understand it.

No, I can cancel posts now (and do so regularly in a.b.a(.d) - although the
ability to define custom headers would be nice, it's easy enough to just
type them in the editor).

By "killfile" I mean a file which is compared to the headers of new
articles, and if a match is made, the article is marked "read" and not shown
to the user. Ideally, this takes place at such a level that when "read for
offline" is selected, the "killed" articles are skipped during download.

Typical killfile (this one is from NewsXpress on my Win95 box here at work):

```
/control
;ignore
:+atari@teleport.com
/*
;chat to girls
;meow
;alt.college.college-bowl
:hal.levy@mail.trilogy.net
:haakon@uffda.telianet.se
:taxes@yourwallet.empty.gov
:bcampbel@freenet.npiec.on.ca
:krunch@intac.com
:+someone@home.thinking.about.you.com
:jedi
/alt.binaries.sounds.movies
;braveheart
;highlander
;halloween
;clockwork orange
;pulp fiction
;the shining
;steel magnolias
```

;psycho
;+star wars megapost:
/alt.2600
;+faq
/comp.sys.atari.st
;chat to girls
;meow
;alt.college.college-bowl
/alt.binaries.pictures.cartoons
:marina.mermaid@colorado.edu
/alt.config
;alt.femfight
:slvrbear@cheta.net
/alt.binaries.sounds.tv
;kids in the hall
/news.newusers.questions
;+meow
:+atari@teleport.com
/comp.sys.atari.programmer
:+rdupuy5596@aol.com

For reference: lines beginning with a slash indicate a newsgroup name;
lines with a "+" as the second character indicate "auto-select" (that is,
"get these immediately") and all others are "shoot on sight" - if it has an
"@" in it it's a From or Reply-To address, else it's a subject.

I would like to be able to compare ANY header, however, so if you're going
to add a killfile capability to Newsie (please? <G>), the "kill" lines ought
to indicate the header to be checked. I'm not sure how to interface that,
but I think I'd put up a window with a "indicate line(s) to select/kill on"
prompt, and show the leftmost 76 characters of each header line.

Of course, the killfile should be stored in plain ASCII so that it's easy to
edit with a tesxt editor; that way, if the user has selected "Path:" as a
kill line, he can pick out just the server(s) to kill (can you say
"CyberSpammo?")

I don't know if you'd want to have a seperate killfile for mail, or a single
file for both mail and news. Anyone else care to add their 2 bits worth
here?

Assuming the Mac has a standard 25-pin plug on the end of the modem cable:

(1) unplug both modems from the ends of the cables.

(2) Toddle off to Radio Shack and buy a 25-pin "null modem" connector. Make sure both ends have female connectors.

(3) Stick the null modem between then two cables.

(4) Start up a terminal on each machine with the bps rate set to 19200, hardware handshake (if possible), 8 bits, 1 stop bit, no parity.

(5) Type something on one keyboard. Depending on how you have duplex set, it should appear on both screens.

# 1609. HD Driver 6.1 demo, et al

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <JdBVWbT.greg_evans@delphi.com>
Source record: 129226

I once had HD Driver version 4.51 but sold it when it would not recognize my Quantum Fireball 1 gb drive. Recently I downloaded the demo of 6.1 and decided to try again. I don't know what I'm doing wrong but it still won't recognize the drive. There are other problems, as I'll explain. Here's my setup, as correctly reported by IDCHECK.PRG when running ICD Pro:

IDE 0: Quantum Daytona 256 mb
SCSI 0: Conner CP30200 212 mb
SCSI 1: Conner CTMS 3200 (tape)
SCSI 2: Quantum Fireball 1080S
SCSI 3: Philips PCA80SC (CD Rom)
SCSI 4: Syquest SQ3270S
SCSI 5: nothing
SCSI 6: Mustek MFS 12000CX
SCSI 7: Atari Falcon 030

When I run the HDDRIVER.PRG it identifies:
IDE 0: Quantum Daytona 256 mb
SCSI 0: Falcon
SCSI 1: Conner CP30200 212 mb
SCSI 2: Conner CP30200 212 mb

I may have as many as four SCSI drives identified as the same Conner 212 mb drive, as SCSI 3 and SCSI 4.

What can possibly be wrong?

Greg

# 1610. Re: Nemesis Benchmarks

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <JfGWmVb.greg_evans@delphi.com>
Source record: 129227

I have an AB040 and Nemesis on order. In the meantime, I was wondering if I can keep my Power-Up which runs the CPU at 32 mhz? From talking to David Encill, it might be possible -- some of the same hardware mods are neede for both. Anyone try this already?

Greg

# 1611. Re: How to set PageStream screen colors?!

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: greg_evans@delphi.com
Message-ID: <B9OVWHa.greg_evans@delphi.com>
Source record: 129228

You'll need to delete your PGS.INF file and restart Pagestream. That
also means you'll have to set up your fonts through manager again.
My guess is your INF file had been originally set for a mono system.

Greg

>Atari fell behind in technology?
>Interesting that they hit the market first in many many areas...all the
>way to the last product...the Jag. Falcons came out when Pentiums were
>still a wet dream...

The Falcon was not a "first". Atari talked about it for an awful long time before actually releasing it, and by the time they did, it was no longer a blockbuster product. You could spend a couple hundred more to get a Mac Quadra 660AV, which had a lot better hardware overall than the Falcon. (I'm not sure that the Quadra was released prior to the Falcon... but NeXT had a 56000 series DSP onboard *long* before the Falcon.)

The ST was not a first. It was clearly a followup to the Mac: offer a cheap GUI alternative to the Amiga and Mac (both of which were more expensive than the ST).

The TT was not a first. 030 machines existed long before Atari finally got on the bandwagon.

Atari was behind the technology curve throughout the Tramiel years. The Jag is possibly the only exception, but they killed it with the trademark Atari cheesy support and marketing.

The blitter takes some of the graphics load off the CPU for quicker
displays. Basically, you can scroll text display in your TOS programs
much faster without needing a accelerator like GEM apps do.

A good programmer can even use the blitter for basic screen swapping
and moving around which improves performance, even in STOS :)

I'm not quite sure, but I guess BigConvert should do that job at your
Atari. Sorry, I have no experience with color monitors.
You can find BigConvert at ftp.tu-clausthal.de and maybe at lots of
other FTP-sites.

Alex

The fact that you can click the B drive button doesn't mean that the drive is recognized.

The usual suspect in cases like yours is that the data cable might need turning, unplug it from the drive and put it back the other way round.

I think that you will also need to change the steprate for the new drive.

Richard could also try NVDI, with the output set to go to a disk file rather
than direct to the printer, if that works then the resulting file could be
sent to the printer from the desktop?

] Is ZORG reliable now? I heard rumors months ago that it can crash your hd.

It certainly buggered up my files very nicely thankyou... Diamond Edge does
too from time to time. I use HD Optimiser now. Excellent.

# 1622. Re: How do I un-MIME????

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: josdb@xs4all.nl
Message-ID: <32eb6098209b0a1@xs4all.nl>
Source record: 129239

on Fri 24-01-97 01:16 Hallvard Tangeraas wrote:

>I had a little trouble finding out what Jos meant by installing it as a
>tool,

There's a .hyp file in the distribution. Get the index, click on
"Tools".

>Don't ask me which parameters they should have and how a file is to
>actually be MIME-encoded/decoded... these UNIX "man" pages are pretty
>cryptic, so I'll probably continue experimenting some more with the whole
>thing.

Say, you want to send a binary file in a MIME encapsulated message.
Start mpack and fill in the following on the command line:

<name of file te be sent/decoded> -o <name of output file>

the program will then prompt you for a subject line. You can
prespecify the subject line on the command line with option `-s'. The
result is a MIME message with a (minimal) header and the binary
encoded in base64. If the binary is too large to send in one message,
you can split it in a multiple message using option `-m <number of
character>'. The name of the output file is suffixed with .01, .02,
etc.

To unpack a MIME message, save the message complete with header, start
munpack and write on the command line:

<name of file to be decoded/unpacked>

You can use option -C to specify a working directory and option -t to
also unpack (non-encoded) text parts. If the message is part of a
multiple message, munpack will save it in a special directory and wait
until all parts are received before constructing the binary.

For both programs the following environment variables must be set:
TMP, for your temporary directory, LOGNAME, and HOSTNAME.

>But please- if anyone knows how to "install" these .TTP programs
>within Packshell I certainly won't complain ;-)

You already know to install them as tools. Now double click on the
icons to fill in the command line that is to be passed to the .ttp
programs. For munpack this could be `$f', and for mpack `-o
c:\tmp\mime $f'. The PackShell desktop works with the `drag-and-drop'
method, so the command line has to contain a variable for the file
name that is dropped onto the program. This is `$f'. The command line

for mpack will always create a file called `mime' (or `mime.01',
`mime.02', etc. in case of a multiple message) in directory c:\tmp.
Change this according to your own wishes.

>I'm also trying to figure out how to install the UUencode.TTP and
>UUdecode.TTP programs with it... (and yes- I've tried all sorts of
>combinations based on the manual, but I can't get it to work).

Same procedure. I don't know which uu programs you're using, so I
can't say anything specific about the command line.

Hope this helps.

>screen. I've fornd two programs which seem to work, each with it's own
>problems:

I want to recommend an excellent shareware programme STARCALL.
I use it for more than one year.
It's easy like Rufus, featured like Connect and is still supported
by the author.
It comes in packet containing 3 programs:
STARCALL - terminal program
STARFAX - faxprogram
STARBOX - the BBS program.

All programs are fully functional, the only limitation of unregistered
version is that before every quitting program displays a shareware
message for 10 seconds.
Packet includes manual in English also.
Actual versions of STARCALL are available at the author in Germany:

Ingo Linkweiler
Marktstr. 48
D-45711 Datteln
Telefon: 02363-55629
Fax/Mailbox: 02363-2610
E-Mail: Ingo Linkweiler @ Do.maus.de

If you want, I can send a STARCALL 2.1A/ENG (version I use) to the chosen
ftp-site.

# 1630. New: QED 3.97, a text editor

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: Guido Flohr <gufl0000@stud.uni-sb.de>
Message-ID: <5cboms$j13@hades.rz.uni-sb.de>
Source record: 129277

Hi everybody!

Ever heard of qed? If you're desperately searching for a quick editor for your Atari especially for programming purposes, yet fully integrated into GEM, qed by Christian Felsch might be a good choice for you.

Qed is known to work on the following systems:

- TOS 1.0, 1.4, 2.06, 3.06, 4.x
- MagiC 2, 3, 4, 5
- MultiTOS 1.04 and 1.08
- MiNT 1.12
- N.AES 1.x
- Geneva
- MagicMac 1.x (68K + PPC)
- STonX
- Tos2Win
- probably yours too

Of course it offers the usual features like search/replace (with Unix-like regular expressions!), block functions, automatic line wrapping, etc.

It supports the AV-protocol, Drag&Drop, OLGA and the SE-protocol (very useful for programming systems). Tags can be used as short cuts for frequently used words/phrases/expressions which makes qed a very comfortable editor when creating source files for whatever programming language you use (sample tag files for LaTeX, C and Modula are provided with qed, others can be created very easily by yourself).

Of course qed offers a context-sensitive online-help system (you need the ST-Guide accessory to use it).

Qed doesn't offer any knick-knack like justified text, dictionaries, speling help, text effects. It's strictly intended for editing purposes. And: don't make friends with the builtin desktop. It will vanish in the near future... (of course you can already switch it off now, like 99 % of the other users).

Sounds good, doesn't it? However, in the past qed suffered from lack of English documentation which made it quite hard to use for English-spoken people. This is no longer a problem. There is a poorly translated (I can say that, because I've done it)

english version available now:

- Bulletin board systems
Maus Hamburg (+49 40 53 89 70 13, "Gruppenprogrammteil" QED)
D-BOX (+49 40 72 91 00 42)
- Internet
http://www.tu-harburg.de/~smcf1605/qed/main.html
click on "Download", the page is in german, sorry :-( or
ftp://ftp.rz.tu-harburg.de/ATARI/qed/

I've probably forgotten most of qed's features, I'm only the
translator. Have a look at it yourself!

Ciao

Guido

P.S.: Almost forgot to mention that qed is free software :-))

Marpet aren't supporting Atari any more AIUI, but their products are still available from Peter Brewster (Alien Technologies), as a part-time venture.

He doesn't have any plans to work on the software I'm afraid.

Speak to 'ya later!

I missed the original posting but to answer on that question just go
to the setup menu go to windows and disable the "window re-sizes to display
all objects". AFAIK this has nothing to do with the fact you are using
a demo-version. I'm a registrated user and I have the same problem.
Apart from this minor misbehaviour Thing is IMHO the best desktop
available for this moment.

# 1635. FS: Atari Computer Goods! Even More Atari Stock! FREE Catalogs!

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: bensmith@teleport.com
Message-ID: <5cckp9$p4j$1@julie.teleport.com>
Source record: 129282
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got Monitors for your Atari 8 Bit like Commodore CM-141 "Like the Commodore 1802" And Disk Drives for the Atari 8 Bit like Stock 1050 and a 1050 Duplicator Drive for Backing Up Software. Plus I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! Plus a Good number of SSI and Avalon Hill/MicroComputer Games, and Many of them are Complete. Plus some Flight Simulator II from SubLOGIC including Scenery Disks all for the Classic Atari 8 Bit. For the Atari ST & newer Computers I've added to my HardWare Catalog Supra Hard Drives, Spectre GCR Mac Emulators, Indus (Future) GTS-100X Disk Drives, Panasonic MultiSync Monitor that does Double Duty for both ST Color and MonoChrome Monitors and the Cable/Hardware to your ST Computer. I've also added Software to my ST Catalogs & revised my prices. Titles such as Brand New copies of Ultima V for those of you Ultima Collectors and for those who like Flight Simulators, theirs F-15 Strike Eagle, F-16 Combat Pilot, Falcon, Falcon extra Missions Disk, Fighter Bomber and Flight Simulator II. In Productivity Software, theirs Data Manager ST, Degas Elite, Easy Draw, MultiDesk, NeoDesk, Revolver & PageSTream. All for the ST.

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Please let me know if I can't attach files to your E-Mail. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Also, on BSC's Home Page! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Page with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Page. The Atari Developers, Sellers & ReSellers of Atari that I go to

From: Guido Flohr <gufl0000@stud.uni-sb.de>
Message-ID: <5cbo6g$j13@hades.rz.uni-sb.de>
Source record: 129284

Hallvard Tangeraas <hallvart@sn.no> wrote:
> Yes, Esscode will do it, but what a pain..... :-(
If you want to do it the classic "Unix"-way, there's help in sight. I've ported the Metamail package (written by one of the MIME "inventors" to the Atari. I have to do a few fixes and will it upload in a couple of days to an ftp-server. If you're interested to get a notice about that, just send me a mail. However, to exploit the full functionality of Metamail, you will probably need MiNT or at least a Unix-like environment. But I think the pure decode/encoder for MIME-Messages will work on a plain ST as well (after you've stripped of leading and trailing plain text by hand. With metamail you don't have to).

What is Metamail?
Metamail is usually called by your mailer (e. g. elm) whenever it encounters a MIME-mail. MM will then examine a couple of configuration files to see what has to be done to display the message. I usually use elm or mutt as my mailer and with the help of MM I can send and receive Mails written in arbitrary character sets, with graphics, sounds, whatever...

It's really fine, but if you don't like .ttp's you probably won't like metamail (although metamail is my interface to GEM for mailing).

Anyway, if you're interested just ask me (I usually don't read this newsgroup...)

Ciao

Guido

To be honest, I doubt very much that Ratsoft is supported by the author
any more, either. His weg page still says 'we should be up by the end of
September - and that was Eptember '96 :( His email address
<ratlabs@ix.netcom.com> returns 'no such user' now, too. Looks like Rat
3 will never appear ;(

>Lharc 3.10.

Actually they are the same thing. The TTP file is the packer/unpacker
itself, while the gem program is a shell to run the TTP. Just replace
the old TTP with the new version (3.12), and read the docs.

I've tried it out, and it seems to be getting better! The speed is impressing - much faster than Cab. There's still a few bugs though; parts of the html-code is sometimes displayed and text formatting doesn't always function properly. But anyway this looks very promising.

When is the full release due? I couldn't find any info on this on Oxo's page... Will the full release include mail and ftp, and what sort of "modules" are planned for it?

Not quite, Aol is crap when it's working as it should Demon however
rarely works as it should but when working provides a very good
service at very low cost.

I don't know the technicalities, but it BlITter stands for "Block Image
Transfer" as far as I know.
It's used to speed up the display. Try to switch it off and see how much
slower screen updates become (i.e when reading the contents of a folder
etc.).

# 1644. Atari Mega ST4 system for Sale

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: machiaverna@worldnet.att.net
Message-ID: <01bc0ac7$0413afe0$522b74cf@default>
Source record: 129291

I have an Atari Mega ST4 system for sale. The system includes the
following:
1) Atari Mega ST4 with "rainbow" TOS ROMs.
2) Atari Color Monitor
3) Atari Monochrome Monitor
4) A/B switch for monitors.
5) I.B. Drive 5 1/4" external floppy drive (360K, double sided)
6) Berkley Microsystems external 66 Meg Hard Drive (connects to DMA port).
7) Lots of software including WordPerfect, system utilities and games.

I am open to all offers! If interested, write to me at
machiaverna@worldnet.att.net

Thanks, Paul

> 'support'?

Ummm... I agree with the feeling of being dumped
and would have liked to have seen bigger and better
things from Atari, but maybe one should try to
purchase TOS from JTS and see what their answer is.
I'm sure they are not giving it away even thou it
would seem there is no "current market" interest in it
at this time. The same situation exist for Amiga users.
Is seems that someone had released an unauthorized version
of the Amiga O/S into the market. The last company that
held the rights made several announcements that they
would not tolerate this act and would follow up on any
illegal activites. I thought that for the last year it
was rumored a few companies were interested in purchasing
TOS. If this is true, it would undermine any effort they
may input into our platforms. Would you (if you could,
it's pretty well copy protected) pirate a copy of Apex
Media? I for one want to see continued developement
of that product and it's offspring even thou I have to
mail my disk half way across the world to have the
upgrade done.
If you already own Logic, Cubase or Chronos then you
deserve the upgrade, free if it is offered or for the
usually minimum fee they request.
There has been lately many request here for TOS images.
A set of TOS ROMS cost next to nothing. Why not just
support some of the last remaining dealers and purchase
a set. If you like TOS, you'll love MagiC so why not
just purchase MagiC PC or MagiC Mac. All the "dirty work"
has already been done there. At least you will still
be supporting the Atari community at large.
With all the request for TOS images, it tends to give
the newsgroup a Windows users flavor.

Any while you Falcon owners are at it, B&C Computer Visions sells Falcon Field Service Manuals for $50.00. Full blue prints and chip specifications. It would save me a lot of time reading.

I "ain't" perfect, but I have a Falcon so I don't have to be:).

My two cents, and sorry i'm on the rag tonight.

Mike

# 1646. PI3 & PC3 conversion

Newsgroup: comp.sys.atari.st

Hello all,

I recently discovered, much to my horror, that I had not converted a pile of high-res Degas format pictures over to my archives on my PC (as I had with all of my color ST graphics. Now, I sold my Mega ST4 off to a friend a few years ago, along with my monochrome monitor, and will all the software that I would have used to convert these PI3 and PC3 pix to somehting portable (like IMG).

Can anyone tell me if they know of...

a) a shareware/freeware utility on the ST that will convert high-res to IMG or some other PC format ON A COLOR MONITOR without first remapping the picture for color rez, or...

b) a PC program that can read PI3 and PC3?

Thanks in advance.

> Your info was informative but not being a programmer I do not know to
> apply any of this!
>
> Any further advice?

Depends on how the game is starting itself. When it uses an autofolder program or a program that has to be started by hand you have a good chance to find the routine using a debugger like bugaboo then you have to disassemble the program, go to the buggy part, reasemble it and pray it still works.

But when the game is starting from a bootsector things get worse then you need a reset resistant buserror catcher that continues the program execution. I never heard of such an utility, but it may exist, maybe there is one in the Double Click utilities.

Both ways require a good assembly programming skills. The first way is the easiest, the second the most elegant.

Bye, Hans Wessels

I've several original boxed, unused Atari games (including some of those
below) that I'm trying to sell. If anyone's interested, a comprehensive
list, (including postage incl. prices - within the UK) can be viewed at:

http://www.polyprss.demon.co.uk/atari.html

those also fonts at /fonts.html and clipart at /clipart.html

feel able to browse at leisure. Or email for whichever list(s) you'd like
to see.

Regards

Kevin

# 1650. GAME HELP PLEASE - 'Future Wars'

Newsgroup: comp.sys.atari.st
Date: 1997-01-25 00:00:00 UTC
From: mwaterhouse@cix.compulink.co.uk
Message-ID: <E4Kr06.EsB@cix.compulink.co.uk>
Source record: 129297

HELP - 'Future Wars - Time Travellers' (Delphine 1989)

We've completed the medieval section, and been transported to the future - Lana (or whatever her real name was) didn't reappear so all alone again (no surpise there).

Problem is, there are two screens of derelict buildings, and nothing but patches of rubble around. There's a funny shaped patch of rubble on the start screen (like half a cartwheel shape on the ground)? We can't seem to walk off these two screens in any other direction. The only items we hold are a lance, key and some documents.

I just know we have to get underground, and this weird patch of rubble seems to be calling, but we can't do anything else!!!?!?!

Any ideas? This is really bugging me!

Cheers

Martin

A little over the top from a simple question ? :)

>There has been lately many request here for TOS images.

thats why I asked the original question of wether it was legal to
send someone a copy?

>A set of TOS ROMS cost next to nothing. Why not just

next to nothing ?, that is reletive surely?, they are too dear in
this house!

>support some of the last remaining dealers and purchase
>a set. If you like TOS, you'll love MagiC so why not
>just purchase MagiC PC or MagiC Mac. All the "dirty work"

Afraid that is an opinion!, magic is NOT better than tos IMHO as it
won't run the same software, magic certainly wont run the software I
have tried, I would have said that for some users MagiC may be an
alternative but certainly not better or even on a par?

>With all the request for TOS images, it tends to give
>the newsgroup a Windows users flavor.

heheh thats because its all windows users asking for it :)

>I "ain't" perfect, but I have a Falcon so I don't
>have to be:).

: And what the hell is that non sequitur supposed to mean?

: Oh, wait, I get it. You're trying to make an obscure and clever reference
: to the scare that artificially inflated memory prices a while back.
: Unfortunately, as a response to the point I was making, it falls flat on
: its face.

: >>So what's your point? That we should stay mired in the backwaters of
: >>computing just to be absolutely guaranteed that a disk swap operation will
: >>never happen?
: >
: > So? How is TOS a backwater? One has yet to address that. All you
: > MacVocates can come up with are application level toys.

: Ah, so now I'm a MacVocate. Funny, I don't seem to recall this thread, or
: at least my participation in it, being about the Mac for quite some time
: now.

: For the record, I have many beefs with the MacOS. I own a Mac, partially
: because it's the last hope for non-Wintel personal computers, but I am not
: uncritical of it.

Well,maybe with Linux it's useable...

: > However, since Petey-Boy himself seems to think that the OS is just
: > a pathway to the apps,

: I don't care what Peter thinks. You're not arguing with Peter. You're
: arguing with ME.

: > then great OS sophistication really isn't
: > required. There is little that MacOS or Win95 has that cannot be
: > grafted upon TOS at the applications level. Most of what they have
: > are bells and whistles.

: There are many things which cannot be grafted at the application level.

: > Software should be designed to run on the hardware of today, no 4
: > years in the future. While petty justifications for braggadocio are
: > nice and all, computers are tools in the end. They either do the task
: > you desire in a satisfactory fashion, or they do not. Beyond childish
: > rhetoric, you have said nothing. How does TOS limit the user? Which
: > of these limits is not addressed by MagiC 4.0?

: Does it have VM? No? Well, that's an obvious start. Does it have much
: in the way of network support? No? Does it have memory protection? No?
: Sounds like a limitation to me. (Maybe things have changed, but in my
: Atarian days there was little to no support for any of these things, and I
: haven't seen evidence of them in my fiddling with MagiCMac.)

: Does TOS have a 3D graphics API? Does it support hardware acceleration
: for it? MAJOR limitation. This is hardware of today we're talking about.

uh,what does 3D graphics have to do with anything?
That's really a driver-level task.(or shared library)

: Does TOS have anything like QuickTime?

Isn't QuickTime a thing like PC's AVI files?
I don't see what animation has to do with OSes.Do you know what TOS is?

: >
: > If, on the other hand, it is likely to go down in a ball of flames:
: > then it's a problem.

: Your postings get more bizarre each time.

: Running out of memory has nothing to do with the OS in question. It's a
: matter of using the memory for programs. If you crank up enough of them
: you will run out. If you run a single program that needs more than you
: have free, you will run out.

: >>I would be very surprised, based on your postings, if you had much of a
: >>grasp of computer architecture. If you do, you sure aren't using it.
: >
: > I have enough to know that SCSI fast wide (or even RAID) doesn't quite
: > compare to multiple IO channels or solid state disk.

: Um, you just demonstrated that you can masterfully make a dumb
: comparison. Big machines might have multiple I/O channels for a RAID --
: what do you think each of those channels is? Very often, fast/wide SCSI.
: You can buy dual-channel UltraSCSI cards for Macs; they're intended mainly
: for RAIDs. (Single-channel RAIDs are possible, but not as fast.)

: > Furthermore, such knowledge really isn't required. All that I have
: > said can be demonstrated empirically with no technical understanding
: > needed.

: First you say you have knowledge of computer architecture, as a way of
: trying to bolster your argument, now you say you don't need it. Make up
: your mind.

: >[deletia]
: >>You're really exxagerating the performance hit quite well. I congratulate
: >>you on your use of polemics.
: >

: > Then I challenge any interested parties to test for themselves.
: >
: > 8ms is a lot faster than 150ns no matter what kind of spin you
: > try to put on things.

: Strange that people don't use hard drives instead of DRAM, then.

: OK, that's a cheap shot. I'll give you the benefit of the doubt and
: assume that you really meant to type it reversed. Simple mistake,
: everybody does it.

: However, you should really look at VM in this light: VM is like having a
: large but very slow memory cached by the computer's DRAM. The computer's
: DRAM is in turn cached by an external "L2" cache, which is in turn cached
: by a internal CPU cache. Ultimately, the CPU keeps data it is currently
: operating on in extremely fast registers. Each level in this memory
: hierarchy is much slower than the one which preceded it. The idea is to
: avoid too many misses so that fetching from the next slowest member
: doesn't happen often.

: The reward is that if the miss rate is kept down, you can make a slower
: but cheap memory perform almost as well as a faster but more expensive
: memory. The techniques for reducing miss rates are well known and are the
: subject of intense research by computer architects. Although the
: techniques used for caches are somewhat different from those used for VM,
: there is a striking amount of similarity.

: Furthermore, both systems have breakdowns. Just as VM can sit there and
: grind the disk continuously, L2 cache can exhibit thrashing behavior which
: makes the system perform worse than it would without any L2 cache.

: In both cases, though, the benefits are too good to ignore.

: >>And what the hell is that non sequitur supposed to mean?
: >
: > It means that some of us have been doing this for awhile and
: > have actual empirical knowledge of the subject that trumps
: > quite a bit of what academia may be feeding you. It's a shame
: > they don't quite feed you enough.

: Ah, an anti-academic. If you can't win an argument, try to paint the
: opponent as living in an ivory tower.

: >>Oh, wait, I get it. You're trying to make an obscure and clever reference
: >
: > Amongst memory consumers, the reference is by no means obscure.

: I am a memory consumer who was hurt by the incident, yet it took me a
: while to remember.

: >>to the scare that artificially inflated memory prices a while back.
: >>Unfortunately, as a response to the point I was making, it falls flat on
: >>its face.
: >

: > Money is never irrelevant.

: So you're trying to say that because RAM was excessively expensive for a
: while, virtual memory is bad? Sorry, either you're gibbering, or you're
: trying to sidetrack from the issue of whether VM is a Good Thing.

: > Perhaps this is the reason Mac is in its
: > current state. When I got my first ST, you could buy a new car for
: > less than some Macs. They're trapped in an academic mentality and
: > aren't capable of real engineering.

: The fact that Apple had models in the 80's which initially retailed for
: more than $5000 (some were closer to $10000) does not mean that they had
: an "academic mentality". It means only that they were targeting a much
: different market than Atari. IMO, it was a mistake for Atari to ignore
: that market, since targeting it would have given the ST much more
: credibility as a serious computer, as well as ensuring that Atari kept up
: with current technology instead of falling far behind like it did.

: It was also a mistake for Apple to ignore the low-cost market until recent
: years. There is no rule that says you cannot design a machine which is
: easily scaled to several levels of price/performance.

: > We are just fortunate that RAM doesn't impose the same kind of
: > constraints that it once did. To believe that it never will again
: > to the same extent is grossly naive.

: In the long run, RAM will get cheaper and denser. This is a very
: non-naive idea based on knowledge of what goes on in semiconductor
: manufacturing. The price scare of a few years ago and the current low
: prices are symptoms of a commodity market. But nothing will change the
: fact that roughly every 1.7 years (if I remember correctly), DRAM density
: quadruples. This is a rule which has held true for 20 years or more.
: It's why I paid $50 or so for 256K of RAM to upgrade my 800XL in the 80's
: and paid $90 for 16 MB of RAM a few months ago.

: >>There are many things which cannot be grafted at the application level.
: >
: > Like What?

: Like anything which needs to be global and standardized. You could try to
: graft something like UNIX pipes onto programs at the application level,
: but it wouldn't be nearly as good as if it were done in the OS itself.

Why not just put it in a seperate programme and then everything accesses
that programme?

: >[deletia]
: >>Does it have VM? No? Well, that's an obvious start. Does it have much
: >
: > It's a poor start. VM is not at all necessary. In microcomputers,
: > it only serves to allow developers to be immensely sloppy.

: How is it sloppy to be unable to anticipate that J. Random User will try
: to run fifteen programs simultaneously on his 4 MB Mac LC? Each of those
: programs could be as tightly coded as possible and J.R.U. would still run
: out of RAM.

I think the point is that developers wouldn't try as hard to optimize.

: I really think you're pulling this out of your hat. Most developers have
: to try to code for the lowest common denominator. That automatically
: includes trying to avoid dependence on large amounts of memory being
: present. As the average user gets more and more memory, developers set
: the bar higher and higher, but in no case do they just sit around saying
: "hehe, let's make our software a pig, we don't care, we don't have to".

: Some developers are clearly much worse at efficiency than others. For
: example, Microsoft Word 6 for the Mac is an insufferable pig, both for the
: CPU cycles it burns and the memory it eats. The user reaction was to dump
: it, something which was probably a factor in Microsoft's recent
: announcement of its creation of a new Mac product division which will
: develop Mac products from the ground up. (As opposed to the current
: policy of doing poor ports from the Windows versions.)

: > Memory Management would be a much better 'modern' requirement.

: Define "Memory Management".

: >>in the way of network support? No? Does it have memory protection? No?
: >
: > Actually, MagiC does. Network support can exist on the application
: > level and has been existent on the ST's for quite some time.

: Network support needs to be an OS service. It is too much to ask every
: application developer to reinvent the wheel.

Why not make it a server like a FTP server.
I have a programme called "WHATIS" on the ST,and I can just type
"WHATIS *.*"
to find out what type of file (BASIC,ML,picture...) each file in the
current directory is.I can also access it through the accesory menu.
The point is that ALL programmes can talk to WHATIS if it's made resident.
They can ask it "What does this header mean" and so forth.
Even if it couldn't be made resident,they could still run on a file
everytime they need to know.(like UNIX)
Doesn't Mac have inter-process comunication?

: MiNT/MultiTOS probably have at least a TCP/IP protocol stack, but there
: seem to be very few people that use those particular offshoots of TOS.

: It is always very funny to see the extremist Atari advocates gloat about
: the LocalTalk compatible port on the Falcon. They never mention the fact
: that Atari didn't have an AppleTalk network driver (and, to the best of my
: knowledge, nobody outside of Atari has ever written one either). A
: network port without the software to support it is worthless.

: >>Sounds like a limitation to me. (Maybe things have changed, but in my
: >>Atarian days there was little to no support for any of these things, and I
: >>haven't seen evidence of them in my fiddling with MagiCMac.)
: >
: > I'll consider this methodology the next time I fire up the PC
: > Mac emulator: Executor. '-p

: You were talking about MagiC. I assumed that MagiCMac is the same OS,
: just running on a Mac instead of an Atari. Did I assume wrong? I thought
: that was the idea behind MagiCMac.

: >>Does TOS have a 3D graphics API? Does it support hardware acceleration
: >>for it? MAJOR limitation. This is hardware of today we're talking about.
: >
: > API's are all applications level.

: You have an odd definition of "application level". Usually it refers to
: code that sits in an application instead of in an OS. An API is the
: interface offered to an application for an OS service.

Or it could be in a shared library.Or simply a small programme that
everybody(programmes) run that most all have.(like grep in UNIX)

: > Although 3D hardware acceleration would be a nice addition.
: > However, this could also be added to TOS with no problems.

: That doesn't change the fact that it's not there.

Well a infinite number of things aren't in there.

: >>Does TOS have anything like QuickTime?
: >
: > For those parts of QT that actually get used: yes.

: What parts do you think don't get used?

He probably means the part to put graphics on the screen,as opossed to the
part that de-codes the MOV file in to said graphics.

: > Although, this is applications level as well.

: Is it? Is it practical to expect every developer who wants to include
: digital motion video in their program to reinvent all of the technology
: that's present in QuickTime? QT means that programmers can easily
: implement fairly advanced features in their programs with minimal effort.
: It means that you don't have to worry about interoperability with other
: digital video programs, because if you use QuickTime you automatically get
: it. Just as an example, you can cut, copy and paste chunks of video using
: standard Mac clipboard operations between any two apps which support
: QuickTime.

: This would be extremely impractical to do at the application level.

Once again,doesn't the MAC have IPC?
(or shared libraries)

>uh,what does 3D graphics have to do with anything?
>That's really a driver-level task.(or shared library)

Actually, a layered approach is best when considering 3D graphics. The Mac
has the following layers:

QuickDraw 3D (shared library)
RAVE (shared library)
RAVE driver (driver)

The idea is that the application programmer gets a nice highlevel API
without having to worry about how the scene is actually being rendered.
As far as I know, TOS does not include a highlevel (or any level) 3D graphics
API.

>Isn't QuickTime a thing like PC's AVI files?
>I don't see what animation has to do with OSes.Do you know what TOS is?

QuickTime is not a file format, it is a multimedia engin.

You're using NOS - in which case, from the NOS command prompt, after logging in, type:

lynx

and hit enter. Presto! Text-only Web browser! You can go to any Web site - you can't see pretty pictures. On properly-designed pages, however, you get an alternate text description of those pictures when running Lynx - and you can download files by highlighting the URL and hitting "D" (for download).

>How do I use these?
>(I have TOS 1)

TOS version doens't matter.

In the root of your boot drive (A: or C:) create a folder named "CPX" and move all the CPX files into there (along with any associated .RSC files).

In the root of the boot drive, put XCONTROL.ACC (or ZCONTROL.ACC if you are running in high-rez). Remove the old CONTROL.ACC - it's obsolete.

After booting, pull down the Xcontrol panel and you'll see a series of (probably empty) slots for CPXes, and there's a button near the top where you can go into setup. You need to tell it where to find your CPXes and save the data. After that, you can click on the left-hand icon to turn CPXes on and off, and the right-hand icon to reload them (and unload the ones you turned off). Also note that there is a limit to how much memory Xcontrol will allocate - that's the "minimum number of slots" entry - it's the /minimum/ limit, but if you can't load all your desired CPXes, try increasing the number.

You can get Zcontrol at
ftp://ftp.cs.tu-berlin.de/pub/atari/Utils/XControl/zcntrl24.lzh

or Xcontrol at
ftp://ftp.cs.tu-berlin.de/pub/atari/Utils/XControl/xctr131d.tos

Just to set the record straight, Demon's "new" newsserver is providing
a 211 response which EXACTLY matches the RFC, so I cannot blame Demon
for the problem with NEWSie. I used Primenet's example, and didn't
allow for the situation that was defined in the RFC.

hmm Cool, lynx, but for what?? Mintnet, linux, Stik????
I use lynx 2.4, but 2.6 would be welcome for mintnet. :)

hmm been there, tried that. :)
It's getting better. :) very promising, but I would like to see how it
reacts with the connection on! :)
It might loose all the speed once online, who knows. ?
I have to say though that despite the fact that the tables are not
correct yet, the dithering into 16 colors is not that great, :(
We'll have to wait and see. :)

Personally I only use MagiC on the Mac. I like to keep my
Falcon set up as simple as possible. I love TOS 4.04.
You must of not understood the term "dirty work" :).
>
> >With all the request for TOS images, it tends to give

Yea, just like the guy at the local PC dealer I overheard
telling his buddy " Well, I can get the CD Rom drivr today
but as you already have Win 95 i'll just use your copy." I
fully endorse that action <grin>, let them kill themselves.
May sound stupid, but I want my own TOS:).

>That's really a driver-level task.(or shared library)

See below.

>: Does TOS have anything like QuickTime?
>
>Isn't QuickTime a thing like PC's AVI files?

No. AVI is just a simple movie format. QT is a generalized format for
data played over time (QT tracks can contain all sorts of different
things). QT is also a complete set of operating system calls to manage QT
data, so that if you are a programmer, you don't have to worry about the
details of it yourself.

>I don't see what animation has to do with OSes.Do you know what TOS is?

Yes. I owned a TOS computer for several years.

In this day and age, a personal computer operating system is expected to
provide a wide array of services above and beyond the basics (memory
allocation, process management, file systems, and basic I/O).

BTW, next time you reply to something, please trim the parts of the post
you aren't responding to.

I have the GEM interface installed on my wife's PC. It's not
nearly as nice as the Atari version, but for file management tasks, it
beats the hell out of the Windoze file manager, and X-Tree. As I
understand it, GEMulator for DOS is now available as freeware, so I'd like
to check that out.

Mega ST's and STe's have a blitter chip. If you don't have one of those,
turning the option on or off doesn't make any difference. I've heard that
Warp9, NVDI, etc. do more-or-less the same thing, which is to speed up
graphics functions.

From: thechyld@pcc-uky.campus.mci.net
Message-ID: <854274948_OASIS_@pcc-uky.campus.mci.net>
Source record: 129174

Well, I've finally gotten hold of a NEC 3D Multisynch for my Falcon and now
I'm selling the Atari PTC1426 monitor that I've been using. Its in perfect
shape, and works fine. I've got the original box but no manual. Comes with
a base, and the cable. Works great with a TT or in 640 x 480 (256 colors)
with the Falcon. (it has a switch on the back to go from TT mode to VGA)
I'm going to let it go for only $100.00 plus shipping. I'll only send it
-CASH- via UPS COD... Please E-Mail your responses. Thanks in advance! :)

>floating about to get it to "work" at 9600, but they were unreliable to
>say the least. Someone will probably have hacked it by now, but it's
>still a bit late ;)

No, it was 9600 right out of the box, but the limitation was that it
required both ends to use a Courier USR 9600 baud modem. I had one hooked
up to my MichTron board but had very few users with the same modem. I
finally removed the modem and reverted back to a more "dependable"
Supra 2400.

Still running one line with MichTron and the other with RatSoft. Once I
upgrade my storage, I'll likely wean myself off the MichTron system and
go full tilt with RatSoft.

BTW, has anyone heard anything about RatSoft 3.0 yet?

-Dana

Look for a program called Graphics Converter. It should be available at
some
ftp sites on the Internet. It accepts a *lot* of graphics formats on
input and
will save the graphic to *any* of its supported formats. I have it for
the Mac,
but I think it is also available for the IBM PC clones.

I really don't understand your question ...
Are you talking about the data base Twist 2 ?
If yes ... what do you want ? Staying in the program without its desk
picture ... I see no way to do that ... even in multitasking (I'm
using Geneva ...)
Tell me more about your question please

Or there is a small program available in the umich archives (I think)
boot.ttp with the parameter -c does a cold boot and clear magic from your
system...archive name is boot.zip

saves wear and tear and is a kinder option to your system.
